2010: Project Completion

Facilities for the Future of Science
A Twenty-Year Outlook

Workshop on Fourth Generation Light Sources
February 2003, 1993
LCLS was a successful multi-lab collaboration
LCLS was a successful multi-lab collaboration
Heavy demand for access to LCLS; only one undulator.
Committee report & presentation to BESAC:

- “It is considered essential that the new light source have the pulse characteristics and high repetition rate necessary to carry out a broad range of coherent “pump probe” experiments, in addition to a sufficiently broad photon energy range (at least ~0.2 keV to ~5.0 keV)”

- “It appears that such a new light source that would meet the challenges of the future by delivering a capability that is beyond that of any existing or planned facility worldwide is now within reach. However, no proposal presented to the BESAC light source sub-committee meets these criteria.”

- “The panel recommends that a decision to proceed toward a new light source with revolutionary capabilities be accompanied by a robust R&D effort in accelerator and detector technology that will maximize the cost-efficiency of the facility and fully utilize its unprecedented source characteristics.”
BESAC Subcommittee
Outcome: July 25, 2013

• Committee report & presentation to BESAC:
  • “It is considered essential that the new light source have the pulse characteristics and high repetition rate necessary to carry out a broad range of coherent “pump probe” experiments, in addition to a sufficiently broad photon energy range (at least \(~0.2 \text{ keV to } \sim 5.0 \text{ keV}\))”
  • “It appears that such a new light source that would meet the challenges of the future by delivering a capability that is beyond that of any existing or planned facility worldwide is now within reach. However, no proposal presented to the BESAC light source sub-committee meets these criteria.”
  • “The panel recommends that a decision to proceed toward a new light source with revolutionary capabilities be accompanied by a robust R&D effort in accelerator and detector technology that will maximize the cost-efficiency of the facility and fully utilize its unprecedented source characteristics.”
Timeline

So far:

- BESAC subcommittee report 25 July 2013
- DoE signed “mission need” for new source 27 Sep 2013
- First collaboration/planning meeting @ SLAC 9-11 Oct 2013
- First complete cost estimate 28 Oct 2013
- **LCLS-II Collaboration Agreement signed** 8 Nov 2013
- Critical Decision 1 – Dept of Energy permission to complete the design
  *
  *
  *
- Project completion – date not “frozen” yet
Project Collaboration: SLAC couldn’t do this without…

- Fermilab
  - 50% of cryomodules: 1.3 GHz
  - Cryomodules: 3.9 GHz
  - Cryomodule engineering/design
  - Helium distribution
  - Processing for high Q (FNAL-invented gas doping)

- Jefferson Lab
  - 50% of cryomodules: 1.3 GHz
  - Cryoplant selection/design
  - Processing for high Q

- Berkeley Lab
  - Undulators
  - e⁻ gun & associated injector systems

- Argonne National Laboratory
  - Undulator Vacuum Chamber
  - Also supports FNAL w/ SCRF cleaning facility
  - Undulator R&D: vertical polarization

- Cornell University
  - R&D planning, prototype support
  - processing for high-Q (high Q gas doping)
  - e⁻ gun option
A New LCLS-II Project Redesigned in Response to BESAC

4 GeV SC Linac
In sectors 0-10

14 GeV LCLS linac still used for x-rays up to 25 keV

North side source:
0.2-1.2 keV (≥100kHz)

South side source:
1.0 - 25 keV (120 Hz, copper” linac)  
1.0 - 5 keV (≥100 kHz, SC Linac)
Linac Design

Linac Acceleration and Compression (100 pC)

Also considering Cornell DC Gun

Includes 2-km RW-wake

A stated project goal is to deliver at least 20 W X-rays from the SC linac to an experiment, independent of repetition rate.

This goal can be exceeded by a large margin with 120 kW of electrons - design goal for beam dumps (M. Santana, THPIO86).

SCRF Cryomodules will go into the SLAC Tunnel

SLAC Linac Tunnel: 3.53m wide x 3.05 m high

It will be a tight fit…

A mock-up of the tunnel and hardware has been built to check clearances

S. Boo, J. Chan
Cryomodule: ILC Type 3 + Some Modifications for LCLS-II

Component design – existing designs

- Cavities – XFEL identical
- Helium vessel – XFEL-like
- HOM coupler – XFEL-like or identical
- Magnetic shielding – increased from XFEL/ILC to maintain high Q0
- Tuner – XFEL or XFEL-like end-lever style
- Magnet – Fermilab/KEK design split quadrupole
- BPM – DESY button-style with modified feedthrough
- Coupler – XFEL-like (TTF3) modified for higher QL and 7 kW CW

Concerns based on global experience

- Tuner motor and piezo lifetime: access points may shorten time-to-repair
- Maintain high Q0 by minimizing flux trapping: possible constraints on cooldown rate through transition temperature

Cryoplant: D. Arenius - THIOB01
Fermilab-developed ‘gas-doping’ process

- A cavity processing recipe that results in high quality factors (>3E10) at operating gradients between 10 and 20 MV/m.
- Starting 2/2014, Fermilab has led a “Qo for LCLS-II” program in collaboration with Cornell and JLab.
- The primary goal is to develop a reliable and industrially compatible processing recipe to achieve an average Q0 of 2.7E10 at 16 MV/m in a practical cryomodule; minimum 1.5E10.
- To reach this goal, the collaborating institutions processed and tested single-cell and 9-cell 1.3 GHz cavities in a successive optimization cycle.
- The deliverable is industrial capability and cost-effective production yield.
  - Supporting the cryoplant design choices
Nitrogen Doping to enable 4 GeV linac, 4 kW Cryoplant
A Breakthrough for CW linac performance

Sample of FNAL single cells results. More than 40 cavities have been nitrogen treated so far systematically producing 2-4 times higher Q than with standard surface processing techniques.

First high Q dressed cavity preserving identical performance pre-post dressing
High Q0 R&D program making rapid progress

High Q0 testing done at 3 labs: Fermilab (from 2012), JLab, and Cornell

Only one vertical test Q0 below 2.3E10
Acknowledgements

JNG and the LCLS-II collaboration gratefully acknowledge invaluable help that LCLS-II has received from colleagues in the ILC Global Design Effort, as well as the European XFEL Project and DESY. Special thanks go to Reinhard Brinkmann and Hans Weise.

JNG thanks Dana Arenius, Paul Emma, Anna Grasselino, Arkadiy Klebaner, Yuri Orlov & Marc Ross & Tom Peterson for the use of their presentation materials.

JNG is fortunate to have the privilege to represent this extraordinary collaboration.
