## Layout + Parameters

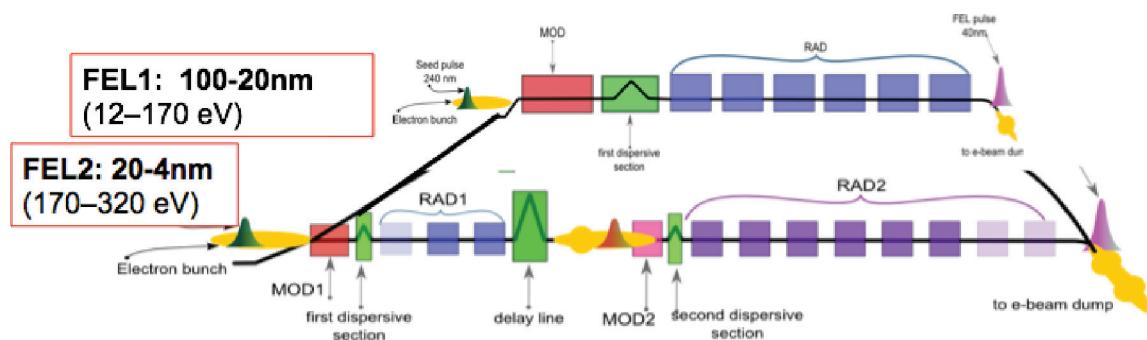

### Parameters:

- FEL-1: 86-20 nm
- FEL-2: 20-4 nm
- Pulse length: <100 fs FWHM
- Bandwidth: 20-40 meV rms
- Polarization: LH-LV-RC-LC
- $\lambda$  fluctuation: within BW

### Beamlines:

- **DiProl:** Diffraction and Projection Imaging (M. Kiskinova, F. Capotondi)
- **LDM:** Low Density Matter (C. Callegari)
- **EIS-TIMEX:** Elastic and Inelastic Scattering (C. Masciovecchio, E. Principi)

Open to external users since 12/2012

2<sup>nd</sup> external users Run: scheduled

3<sup>rd</sup> call for users: deadline in 10/2013

FEL-2 open to users in late 2014

### Motivations

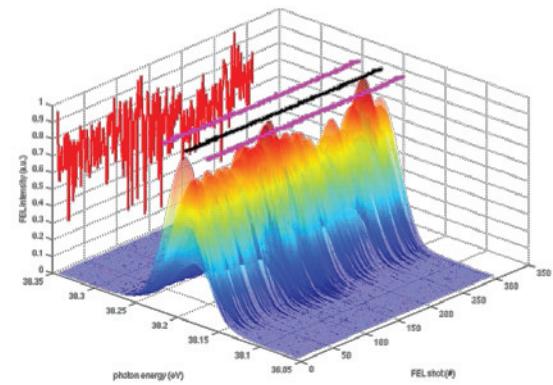

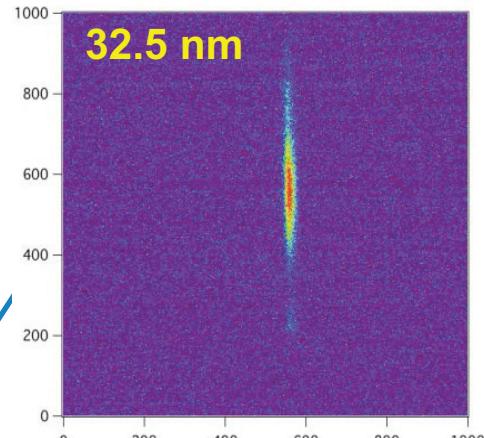

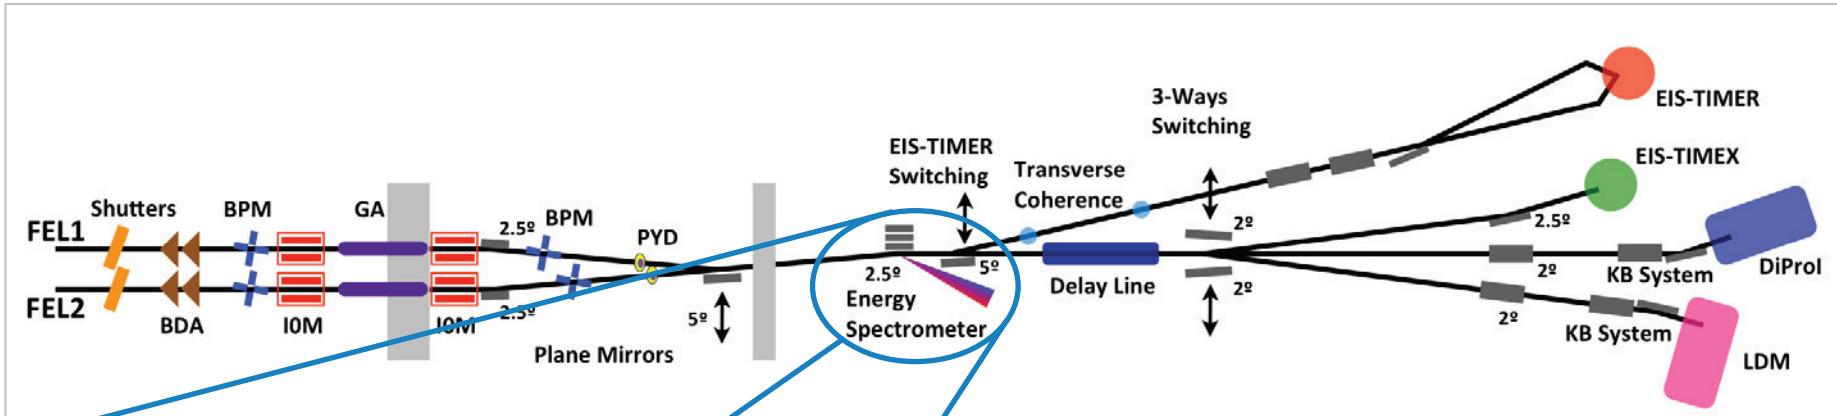

- Pump-probe techniques to study non-equilibrium transient states of matter → extended to HHG- and FEL-generated pulses (either X-ray or synchronized optical and X-ray pulses pairs)
- Advantage of XUV/X-ray photons:  
they can stimulate and probe electronic transitions from core levels, providing chemical selectivity as well
- Ultrabright FELs overcome the pulse intensity and wavelength tunability limitations of HHG sources

### Requests

- Generate two FEL pulses with precisely controlled time delay, wavelength and intensity ratio
- Perform proof-of-principle XUV-pump / XUV-probe experiment that examines the dynamics of a thin-metal layer structure exposed to high intensity XUV excitation

# PHOTON TRANSPORT SYSTEM

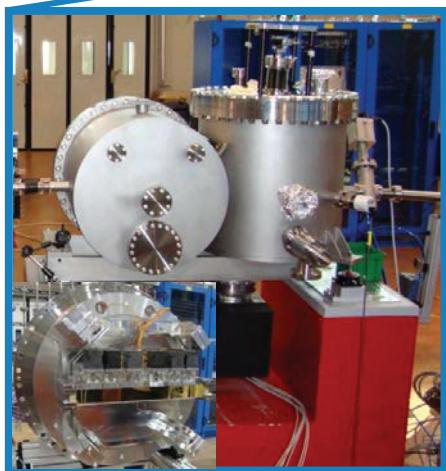

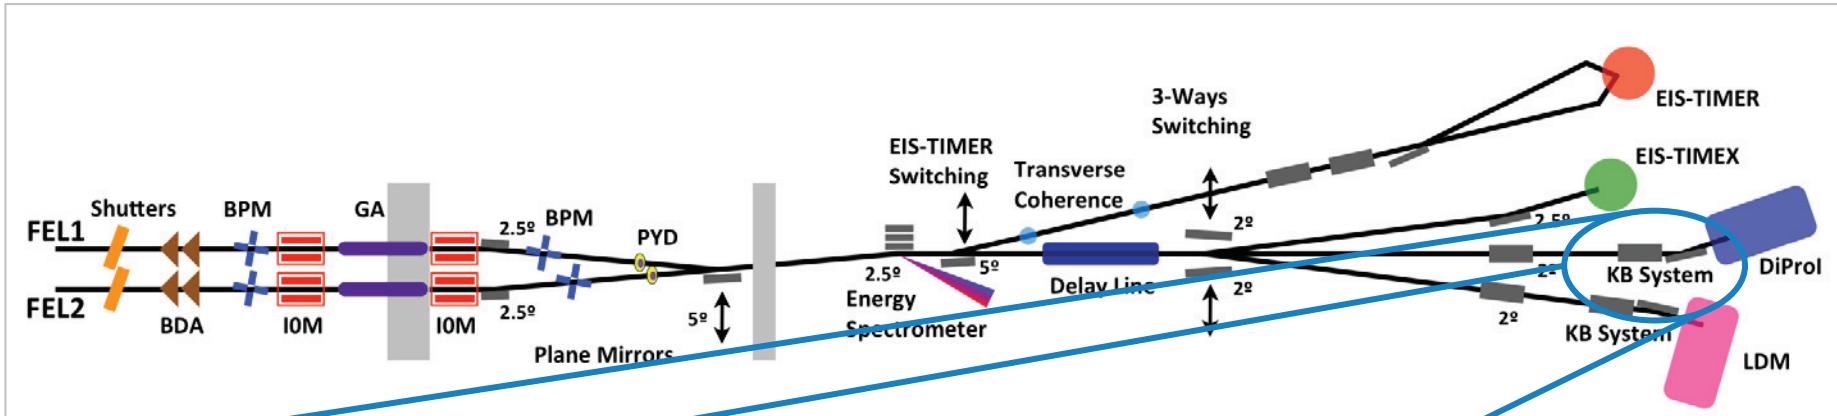

## Energy Spectrometer

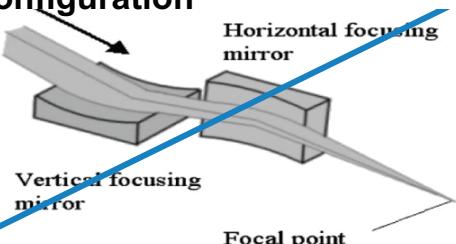

- Online (non invasive)
- Shot-to-Shot
- ~97% of FEL → beamlines
- 1% of FEL → YAG + triggered CCD
- Resolving Power ~15000 @32.5nm (2.5meV)
- Available information: wavelength, BW, spectral content

**FEL photon energy**  
 $38.19\text{eV} \pm 1.1\text{meV}$  (rms)  
**FEL bandwidth**  
 $22.5\text{meV}$   
**Spectral purity**  
 $5.9\text{e-4}$

# PHOTON TRANSPORT SYSTEM KB focusing mirrors

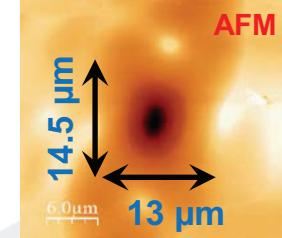

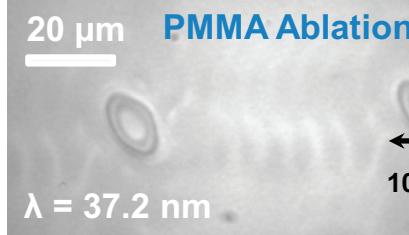

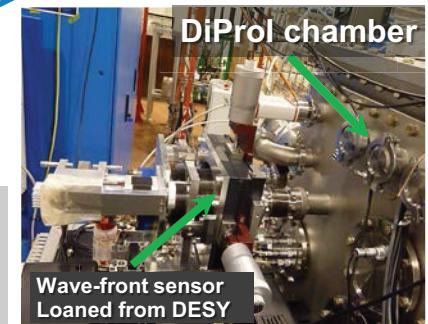

**KAOS**  
(Kirpatrick-Baez Active Optics System)  
**Bendable plane mirrors in**  
**Kirkpatrick-Baez**  
**configuration**

**Focal length:** 1.2-1.75 m  
**Incidence angle:** 2°

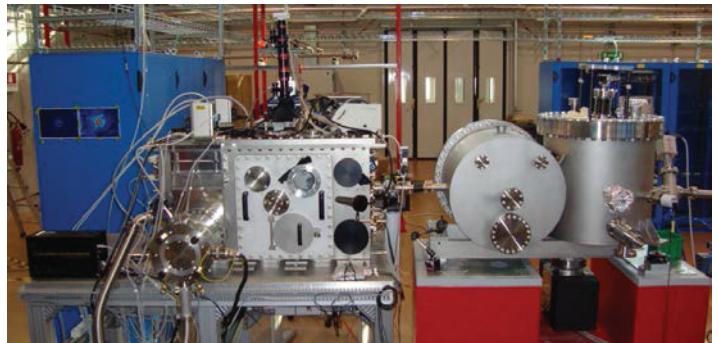

WFS measurements in collaboration with:  
L. Raimondi and PADReS  
DESY + Laser-Lab. Gottingen  
Image Optics + CEA and LOA

**Best spot 10  $\mu\text{m} \times 13.5 \mu\text{m}$**

# DiProI ENDSTATION

## Core capabilities

Installed on dedicated FERMI beamline: June 2011  
Open to User Experiments: December 2012

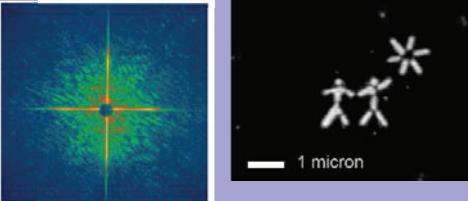

**Versatile modular construction  
allowing exchange and/or adding  
new components**

# DiProI ENDSTATION

## Commissioning results

## Pulses Generation Scheme

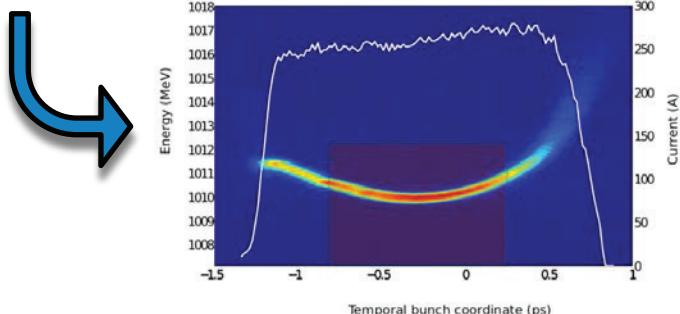

Achievable delay: 300 – 700 fs (December 2012)

### Seed pulses:

independently tunable in 260-262 nm  
180 fs-long (FWHM)  
variable time separation and intensity ratio  
splitting introduced in the seed fundamental

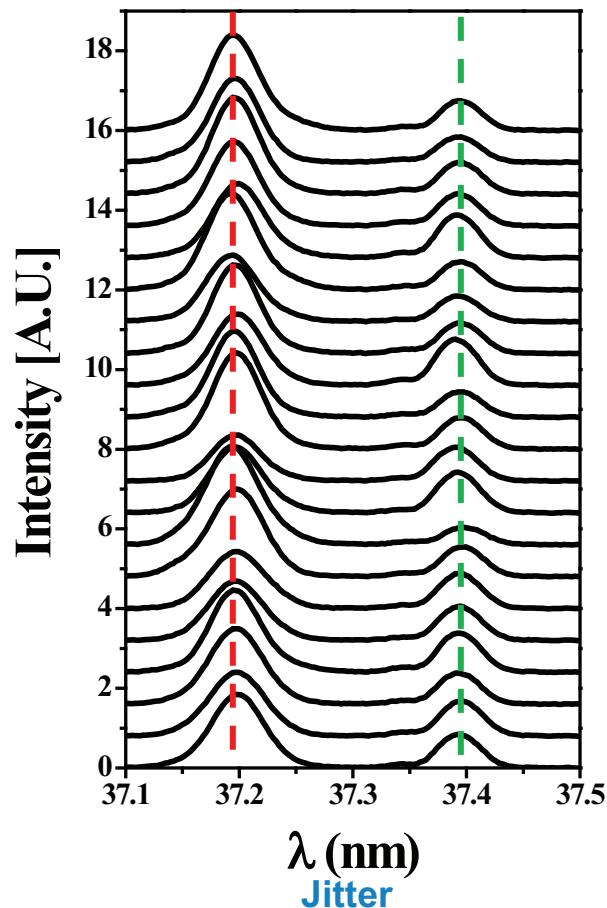

### e<sup>-</sup> bunch:

mildly compressed 750 fs-long  
preserve the temporal uniformity of current and energy

## TWO-COLOR EXPERIMENT

### Scheme + Source features

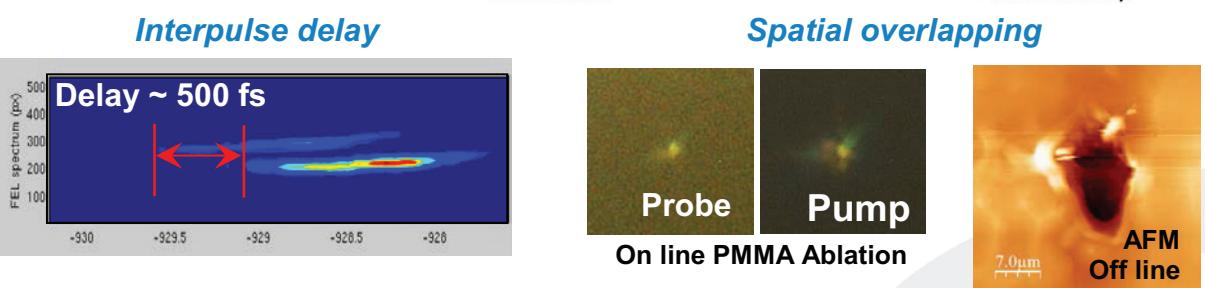

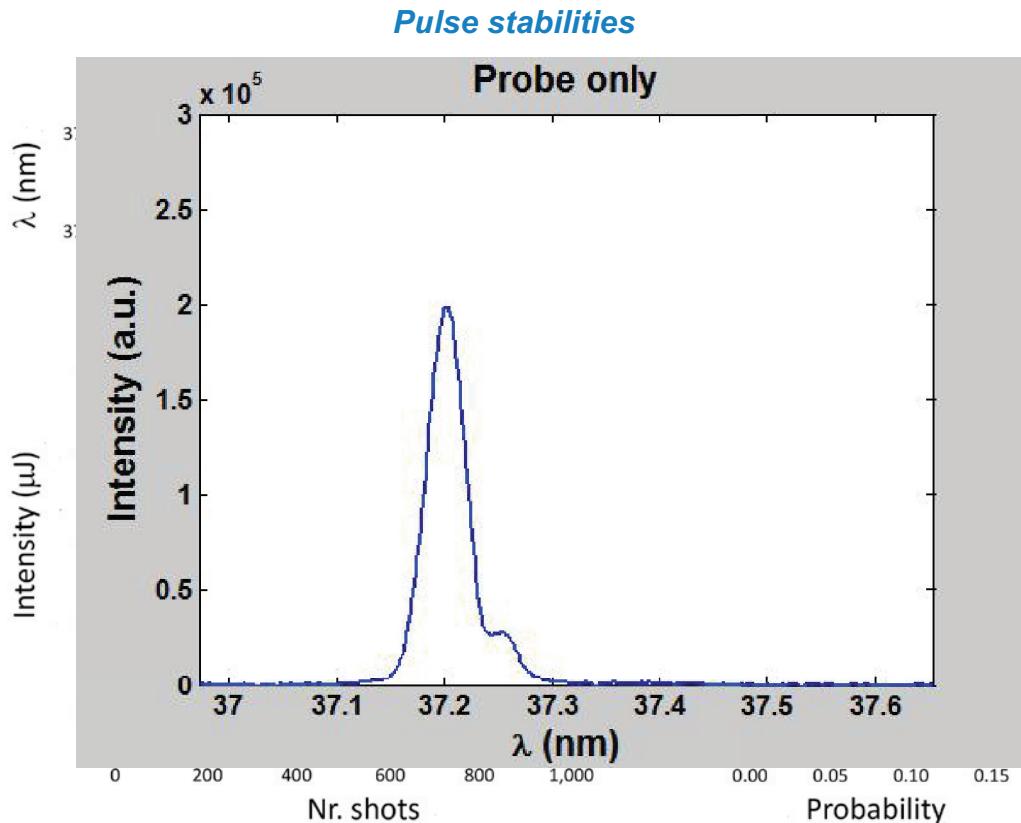

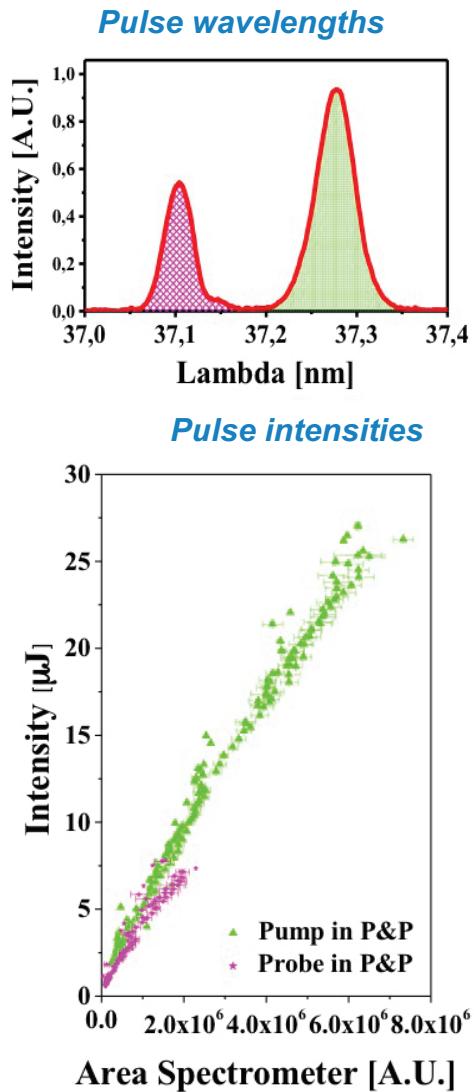

0,005 % Shot-to-Shot spectral  
~15% Shot-to-Shot intensity

### In collaboration with:

F. Bencivenga, D. Fausti, Fermi Commissioning Team (L. Giannessi, E. Allaria, et al.)  
Lasers Team (M. Danailov, et al.), PADReS Team (L. Raimondi, M. Zangrandi, et al.)

# TWO-COLOR EXPERIMENT PRESTO + KAOS

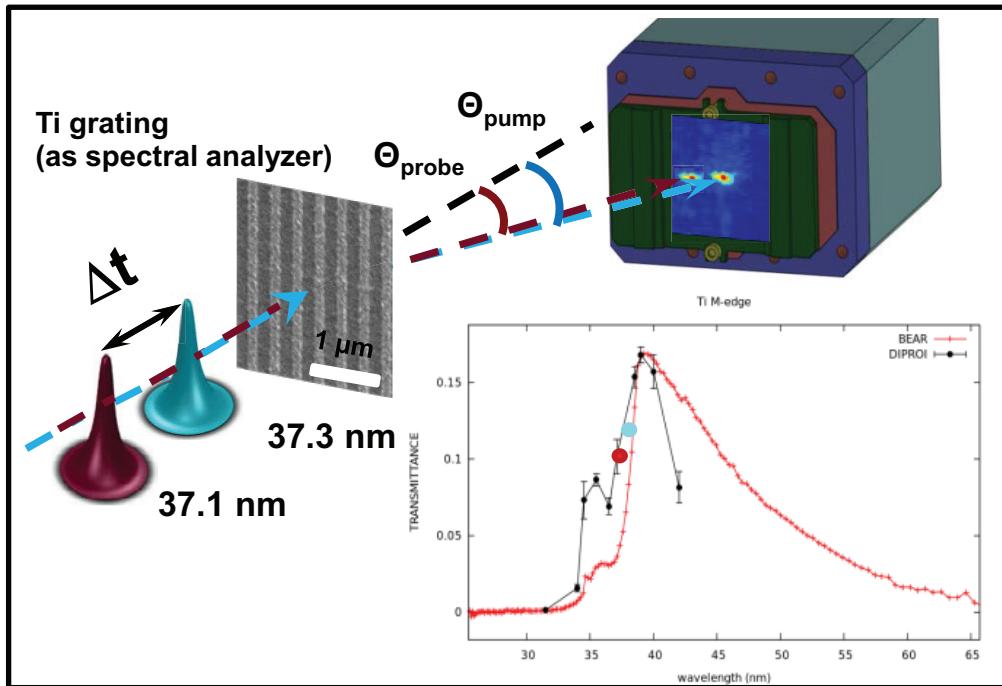

E. Allaria, et al., Nature Comm., to be published (2013)

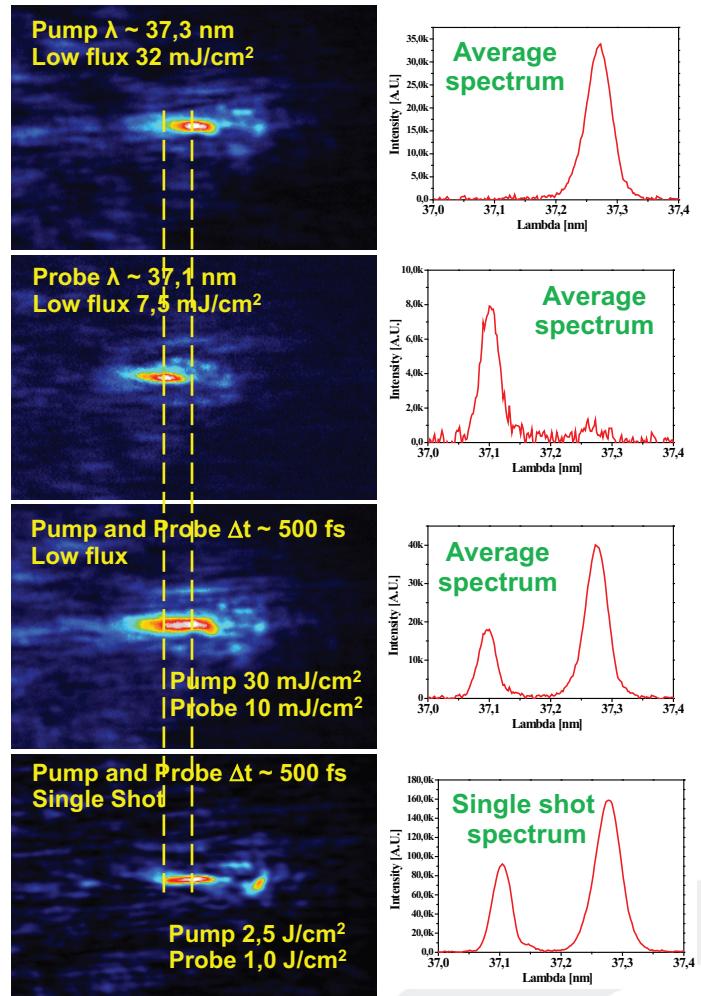

# TWO-COLOR EXPERIMENT

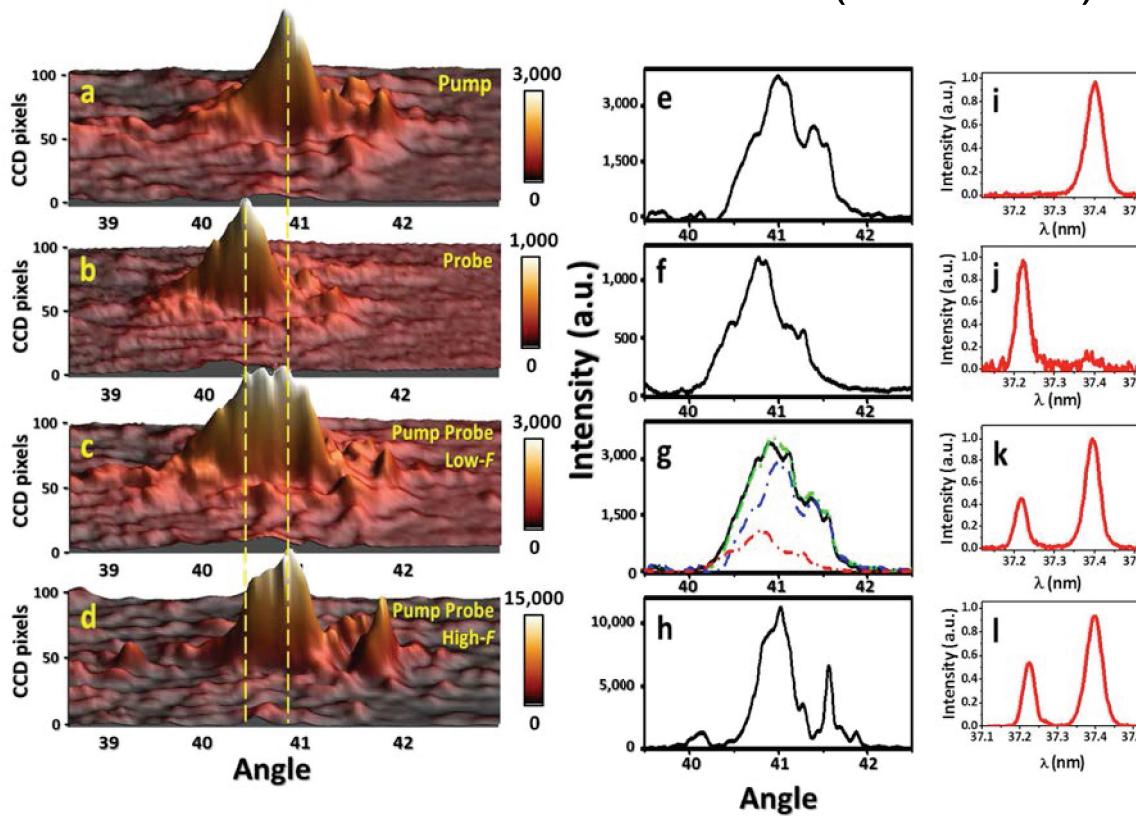

## Experimental setup + Results

### Two pulses tuned to wavelengths across the Ti- M edge

The two pulses have different wavelengths so to be diffracted at different angles → detected at different positions on the CCD

TWO-COLOR EXPERIMENT  
Results (continued)

At high fluence → evidence for dramatic changes in the Ti electronic structure: high degree of ionization that shifts the Ti edge to shorter wavelengths making the grating ‘transparent’ for the second pulse [low-F → <1% of Ti atoms ionized – high-F → ~100% of Ti atoms ionized (in some tens of fs)]

The pulse length (~90 fs) and the delay (max 500 fs) are shorter than the time scales of hydrodynamic expansion 1 - 10 ps

E. Allaria, et al., Nature Comm., to be published (2013)

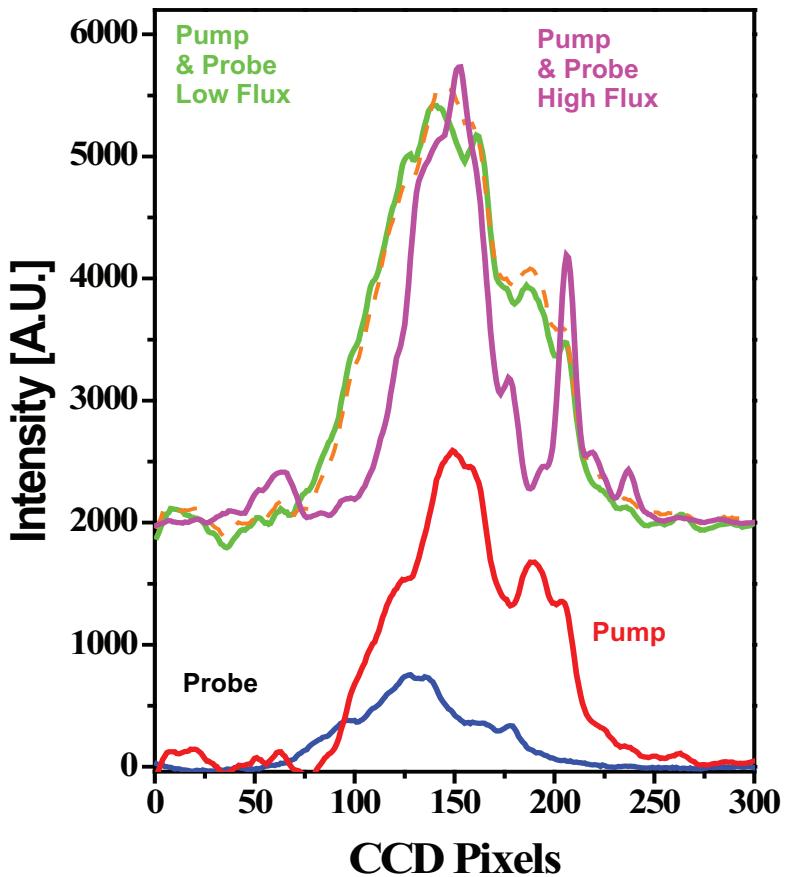

# TWO-COLOR EXPERIMENT

## Comparison with theory

PRL 107, 218102 (2011)

PHYSICAL REVIEW LETTERS

week ending  
18 NOVEMBER 2011

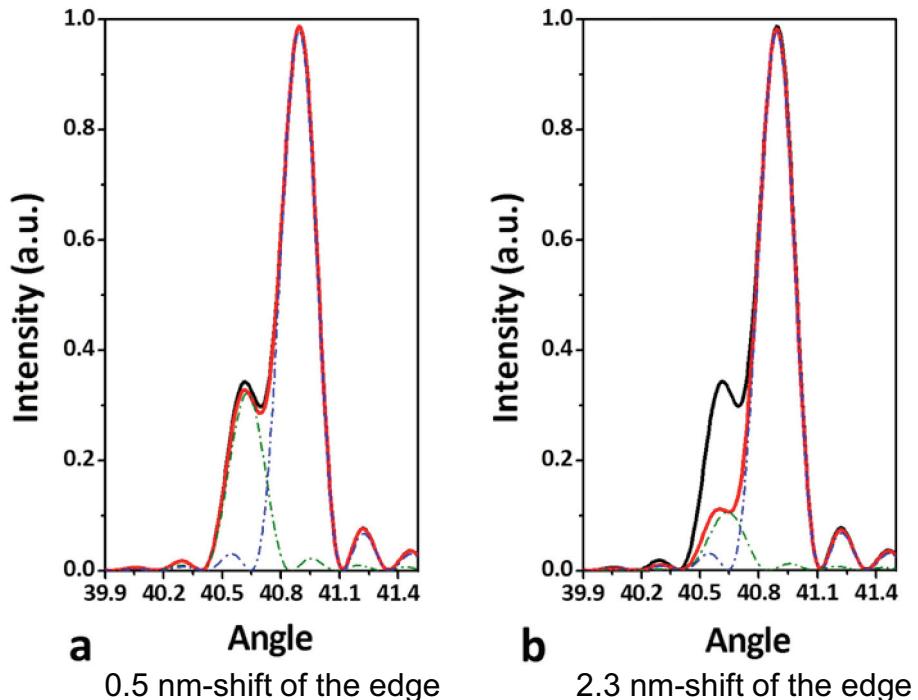

### Multiwavelength Anomalous Diffraction at High X-Ray Intensity

Sang-Kil Son (손상길)<sup>1,\*</sup>, Henry N. Chapman,<sup>1,2,\*</sup> and Robin Santra<sup>1,2,†</sup>

<sup>1</sup>Center for Free-Electron Laser Science, DESY, Hamburg, Germany

<sup>2</sup>Department of Physics, University of Hamburg, Hamburg, Germany

(Received 23 May 2011; published 14 November 2011)

The experimental results can be reproduced using a 2.3 nm-long edge shift i.e., when the probe  $\lambda$  is not anymore in the absorption edge window

# TWO-COLOR EXPERIMENT

## Reducing the interpulse delay

The present scheme (2 seeding pulses) can generate interpulse delays down to 150-200 fs. To decrease further the delay (to values comparable to the FEL pulse length) a different approach should be followed:  
**seeding with a single, frequency-chirped pulse → spectro-temporal splitting in FEL deep saturation regime**

PRL 110, 064801 (2013)

PHYSICAL REVIEW LETTERS

week ending  
8 FEBRUARY 2013

### Chirped Seeded Free-Electron Lasers: Self-Standing Light Sources for Two-Color Pump-Probe Experiments

<sup>4</sup>ENEA C.R. Frascati, Frascati 00044, Italy

(Received 9 August 2012; revised manuscript received 16 December 2012; published 4 February 2013)

- FERMI and DiProL: operative and versatile
  - Successful generation of two FEL pulses with precisely controlled wavelengths, time delay and intensity ratio
  - Test experiment on Ti-grating: successful
- 
- Further investigations with different delays (50-300fs → 1ps)
  - Investigation of magnetic phenomena varying the interpulse delay and intensity ratio

# COLLABORATORS

## Internal and external

Elettra Sincrotrone Trieste

**DiProl:** M. Kiskinova (coordinator), F. Capotondi (BL scientist), E. Pedersoli (post-doc)  
**Lasers:** M. Danailov, A. Demidovich, I. Nikolov (pump&probe laser)  
**Others:** R. Godnig (technician), R. Menk (consulting for detectors), R. Borges (software),  
C. Spezzani, F. Bencivenga, C. Masciovecchio, D. Fausti, and all the FERMI

### TEAM
