

Upgrade of Beam Phase Monitors for the ESRF Injector and Storage Ring

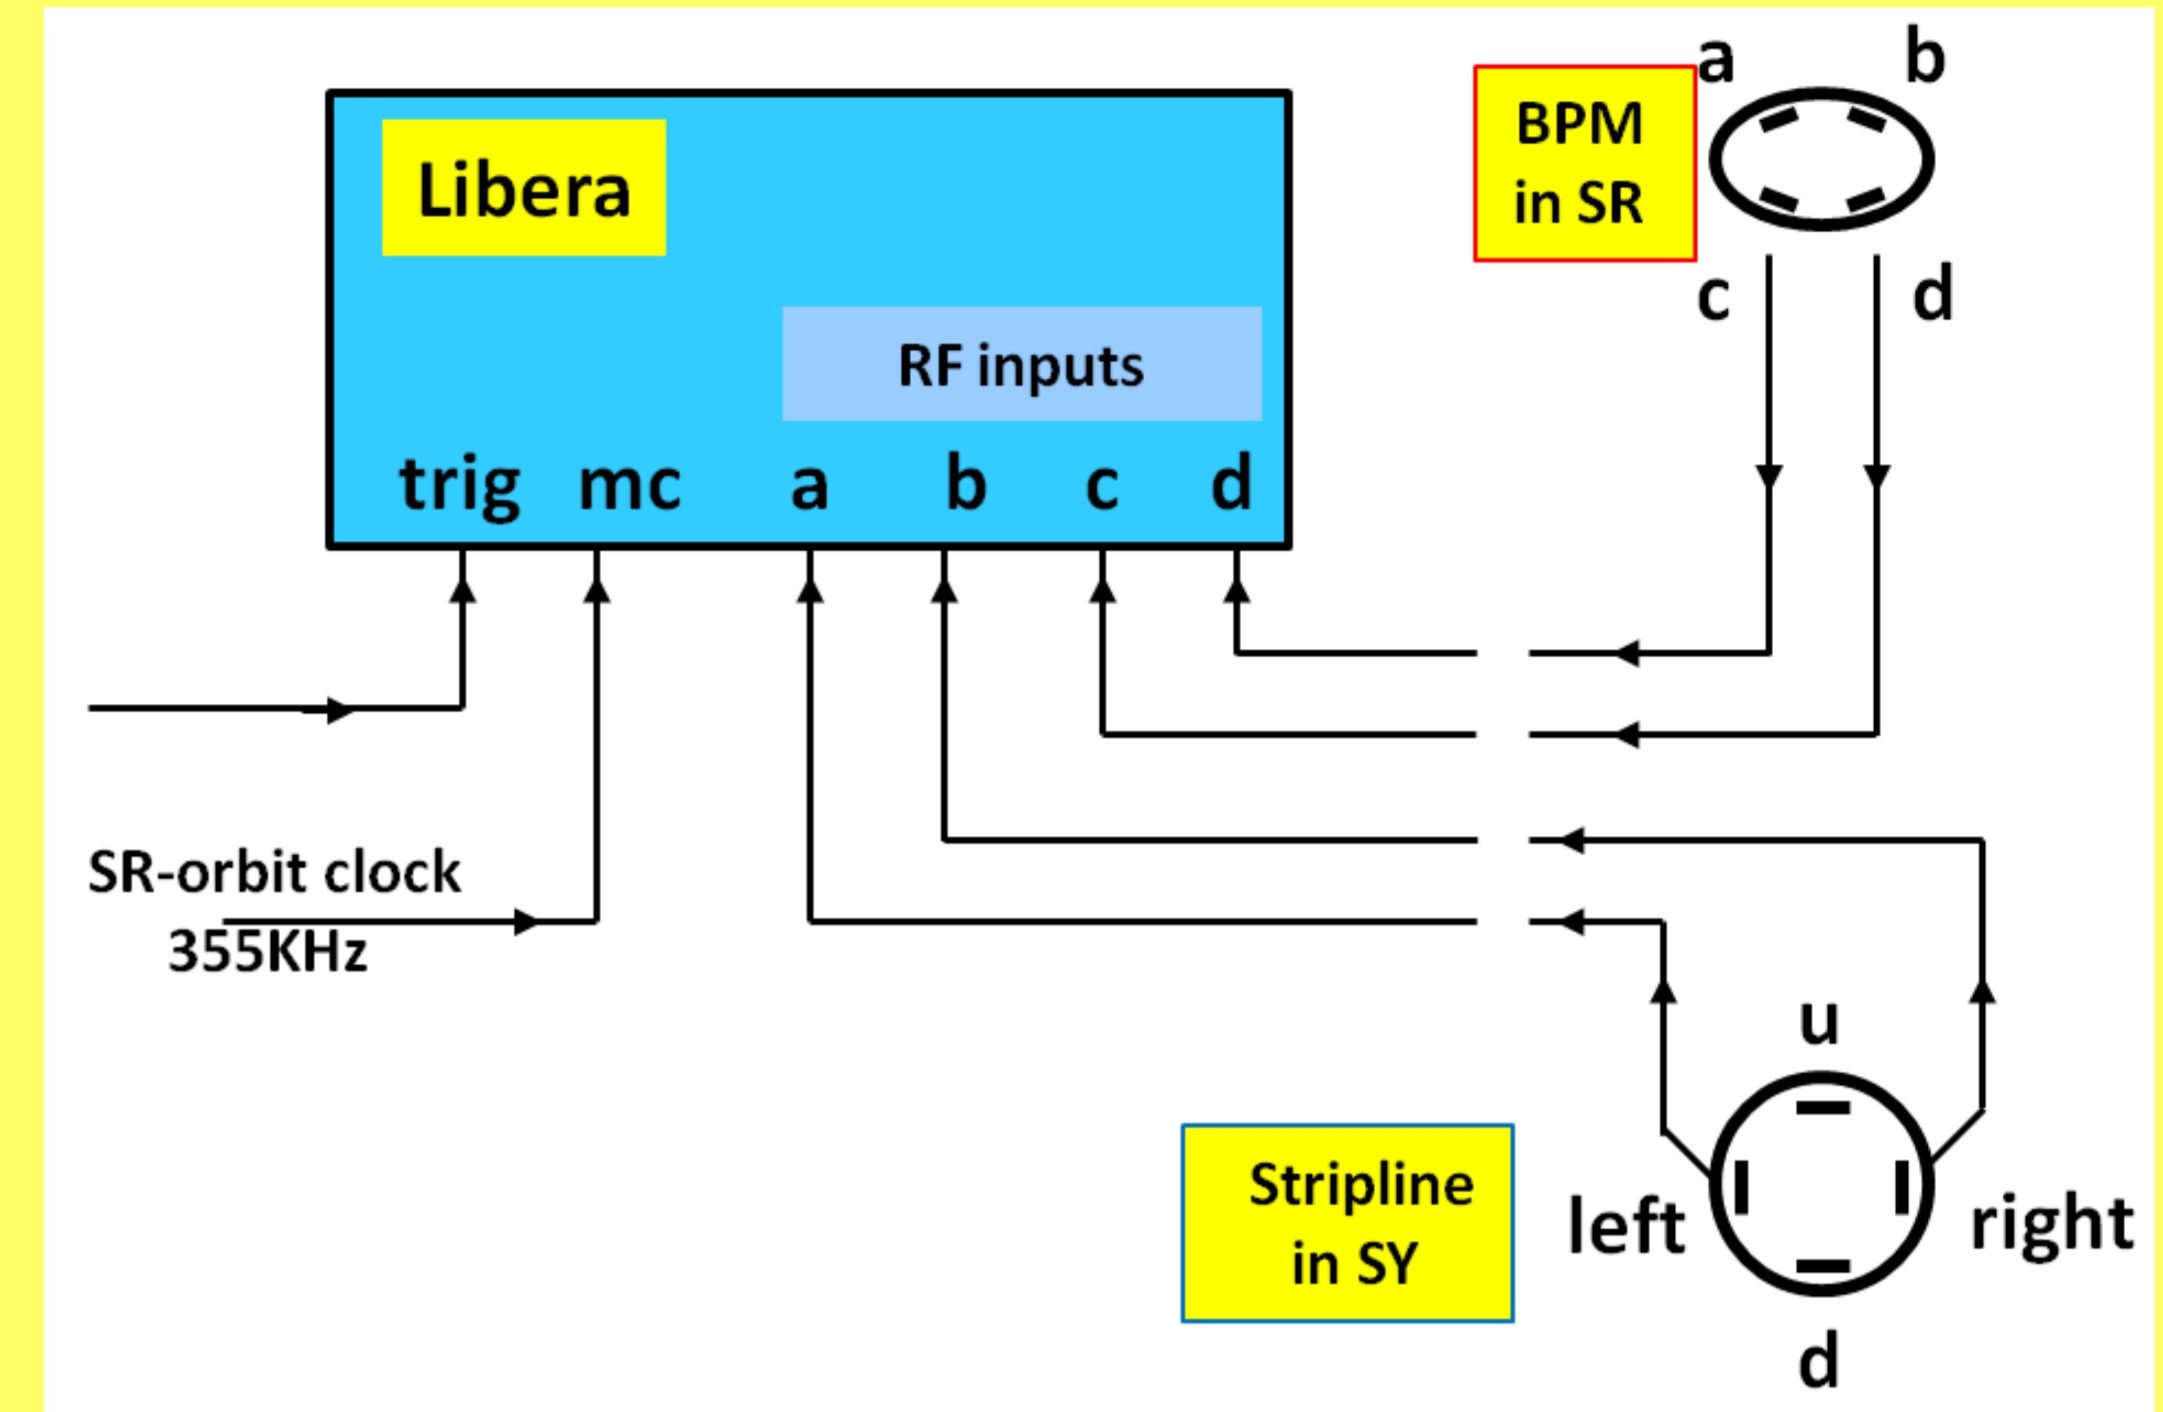

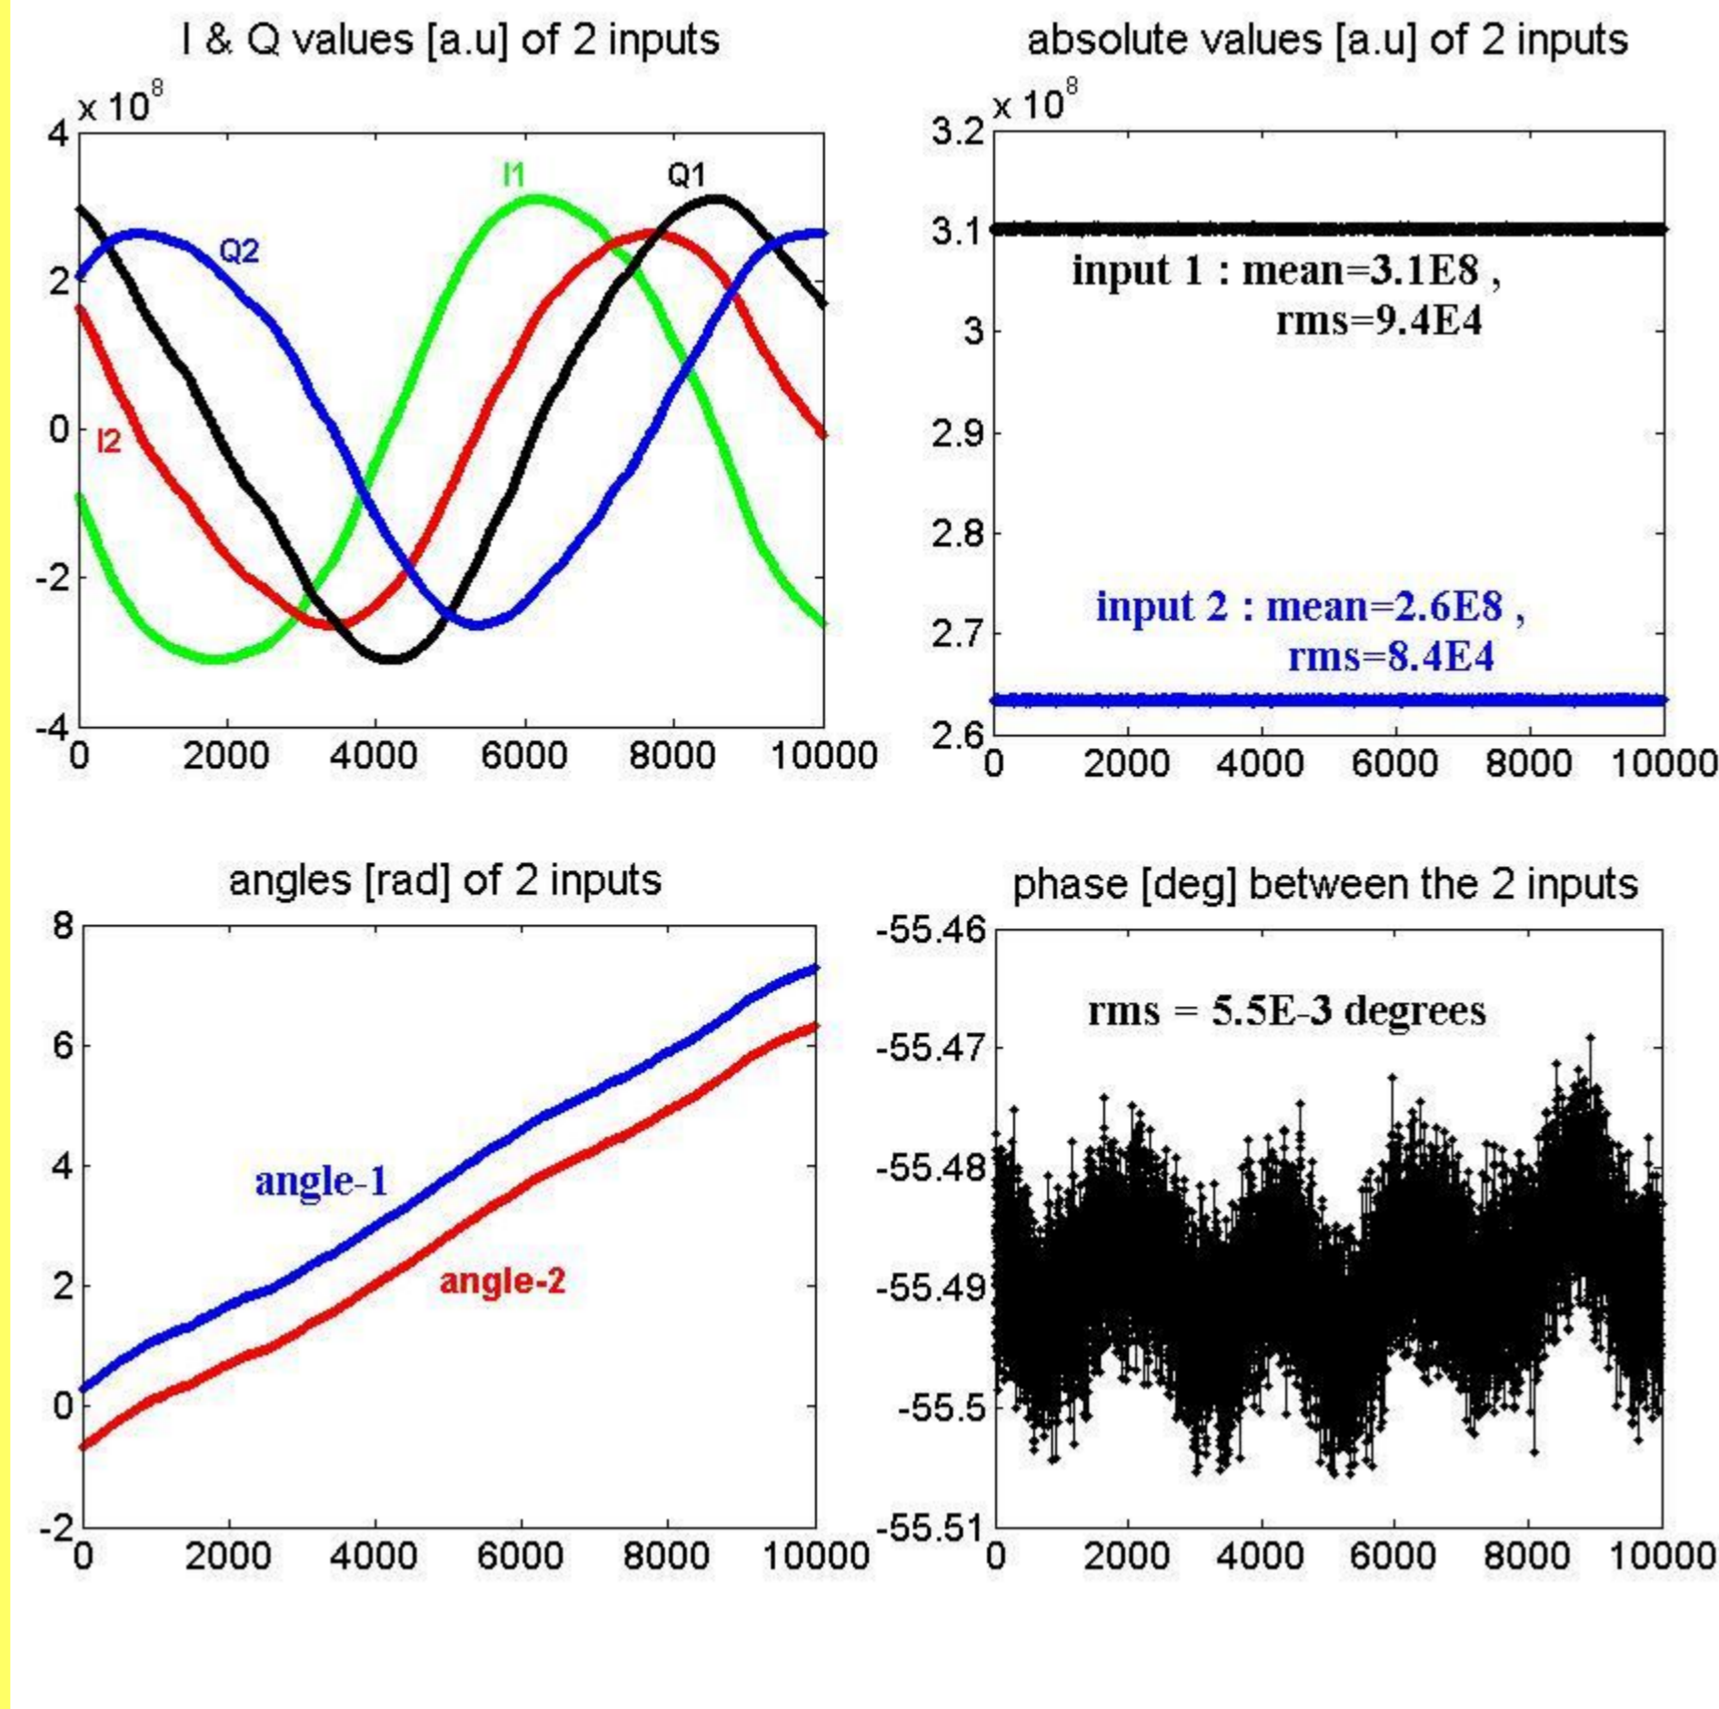

Kees SCHEIDT, Benoit JOLY,
Diagnostics Group, Accelerator & Source Division, ESRF, Grenoble, FRANCE

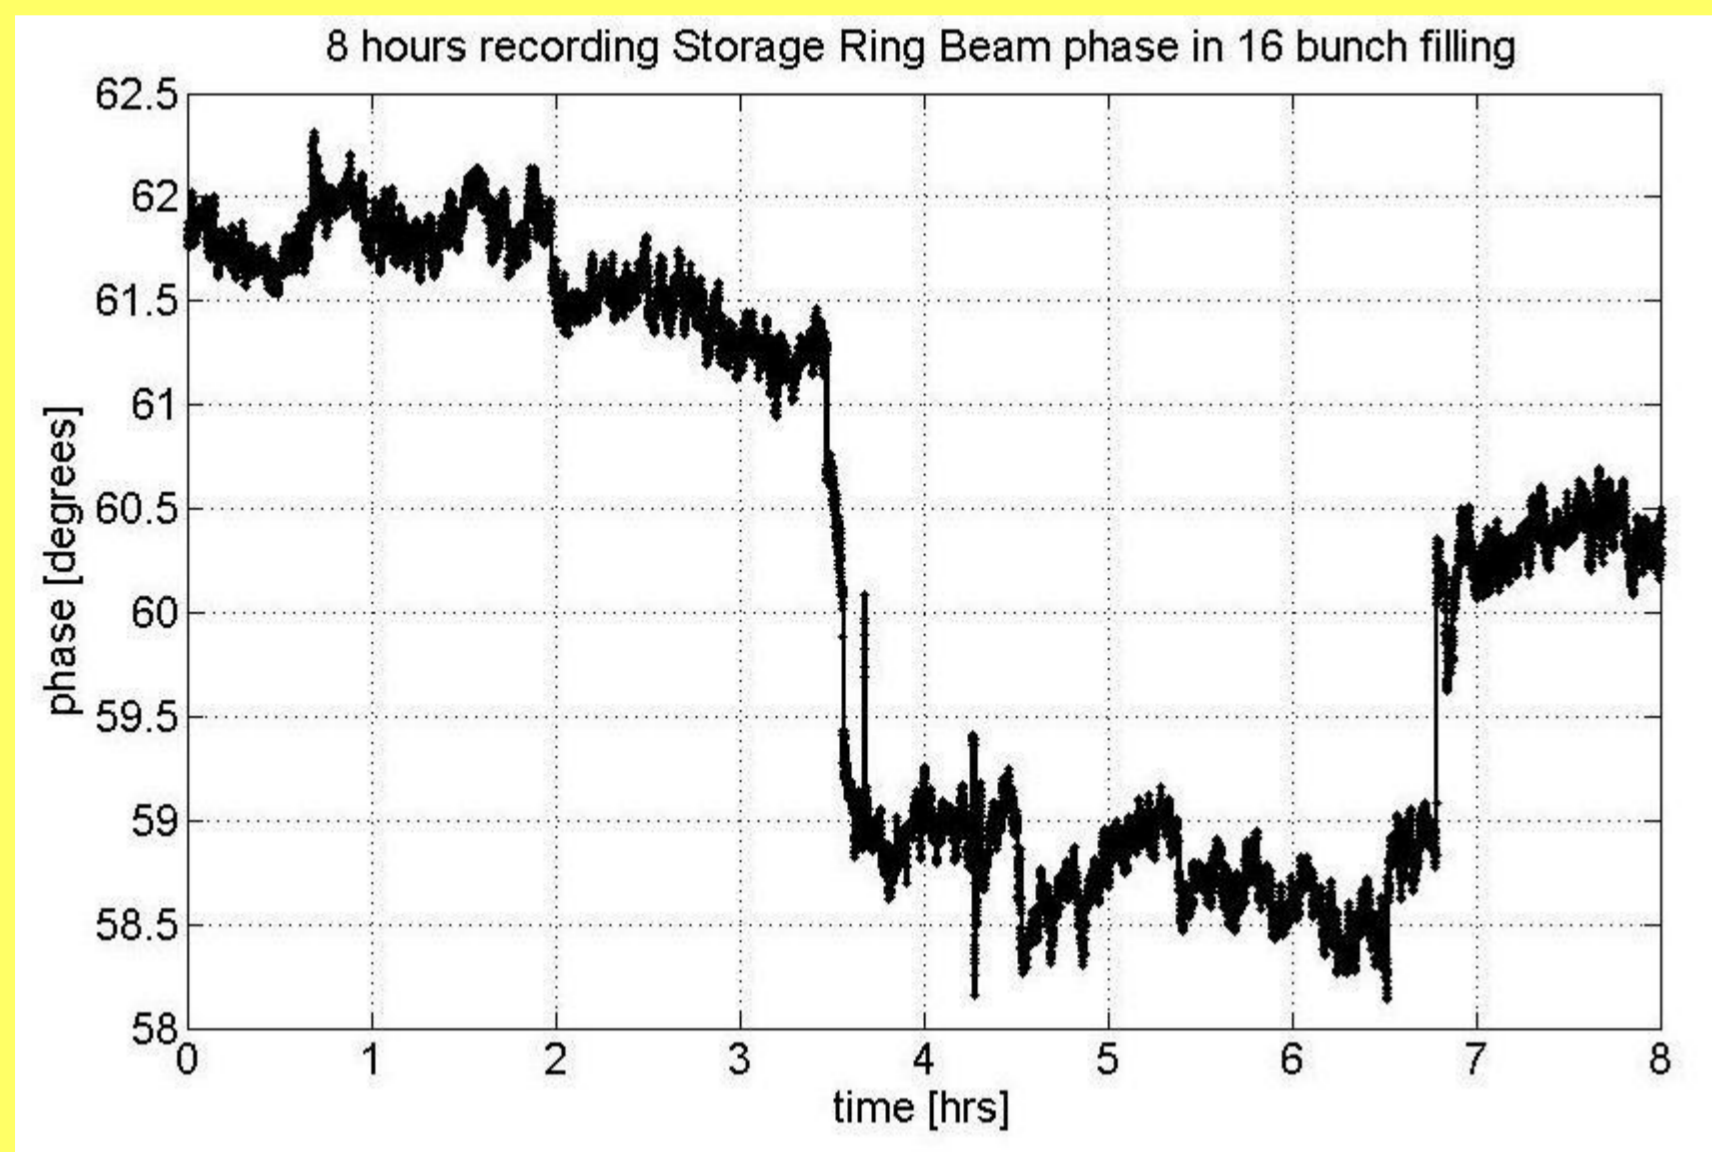

Hardware & interconnections of the Storage Ring versus RF-master Phase monitor

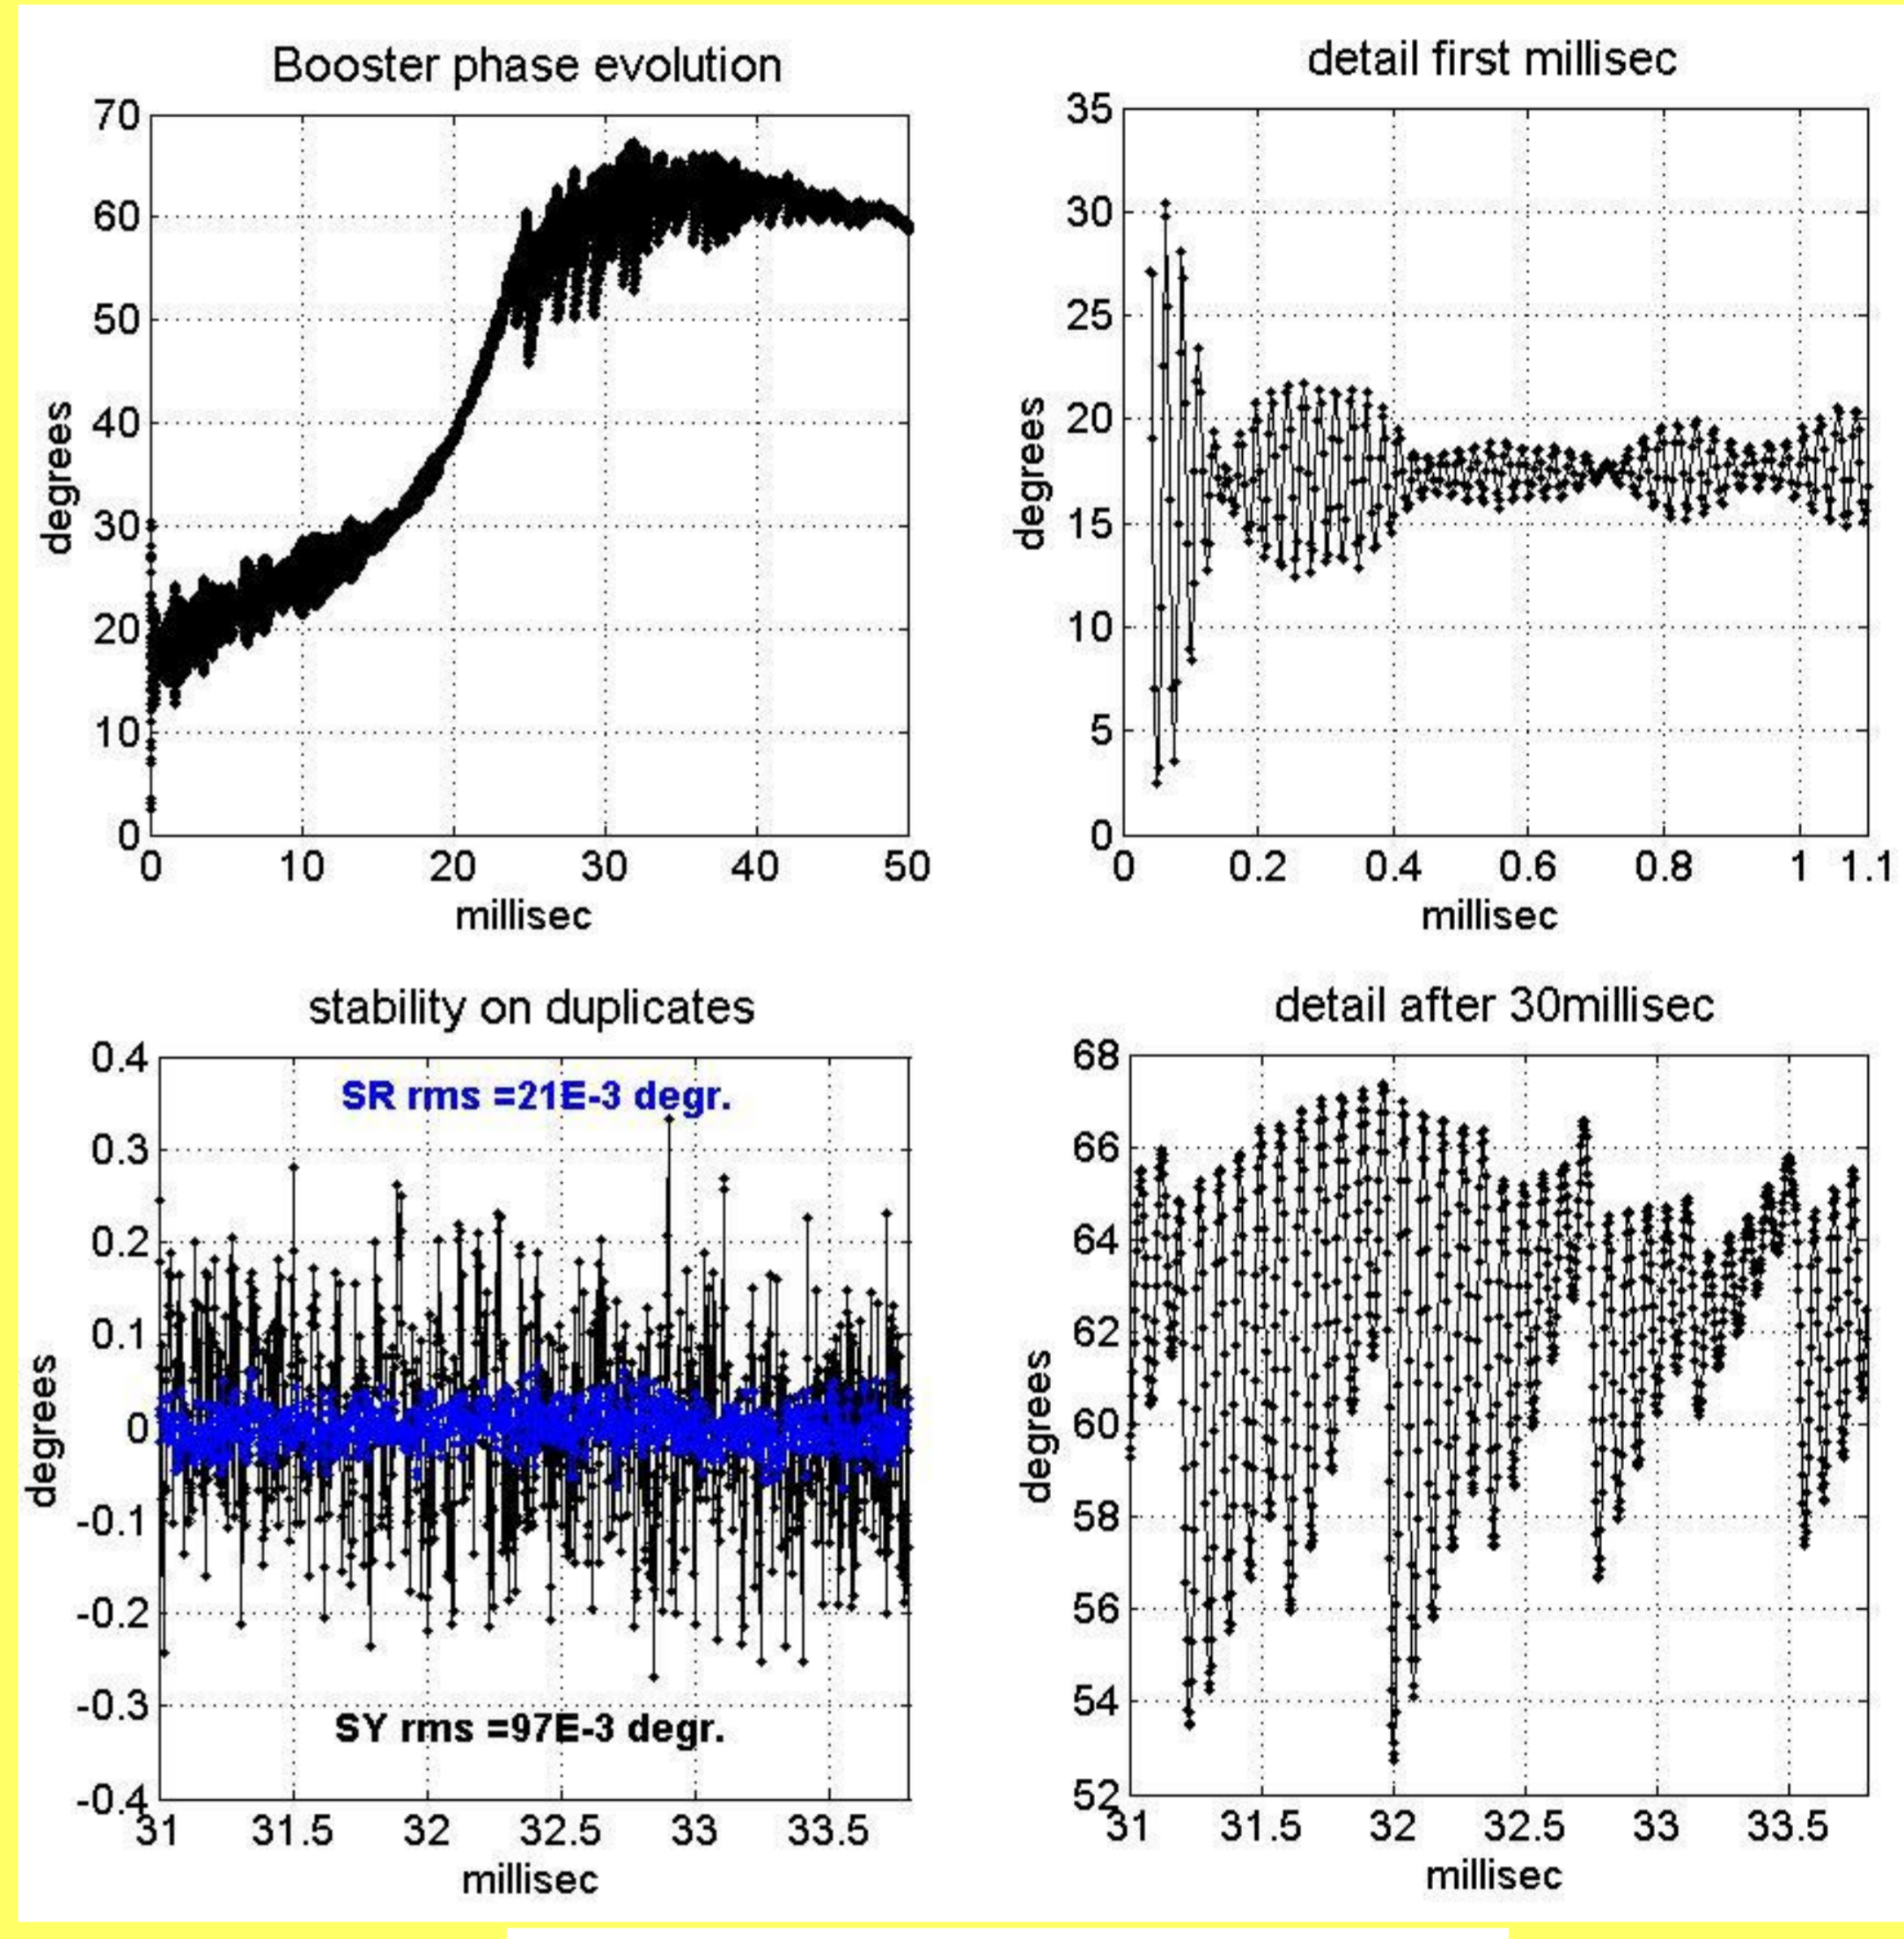

with a pseudo PLL system inside the Libera only relative phase measurements are possible between the 4 RF input signals

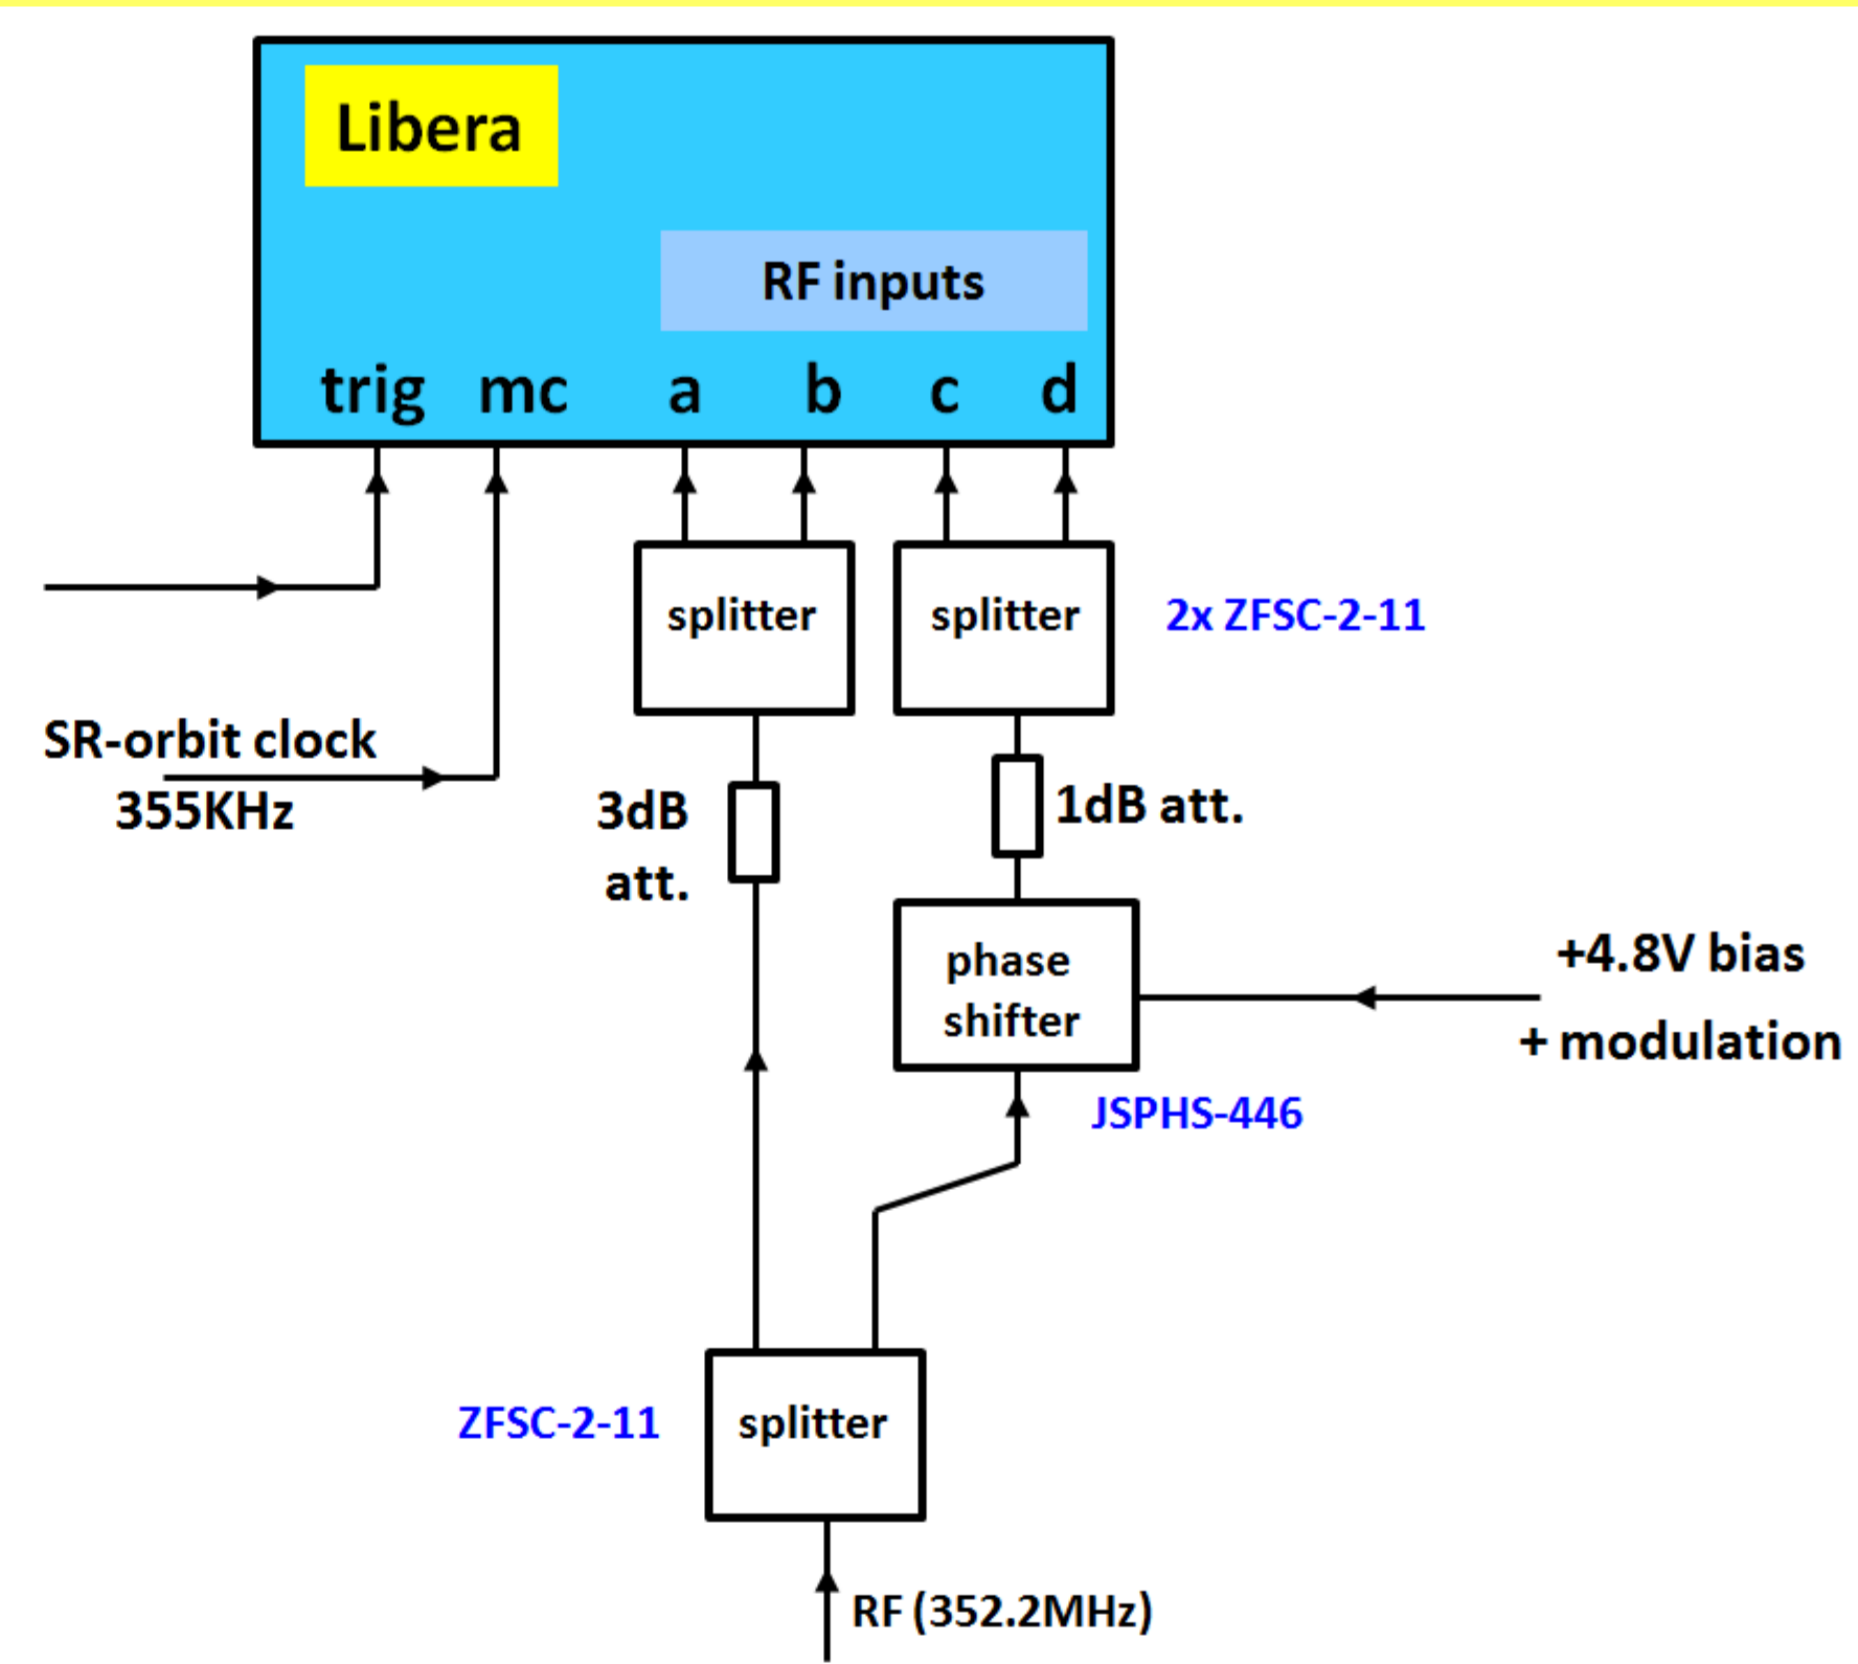

Hardware & interconnections of the Booster versus Storage Ring Phase monitor

Libera Brilliance

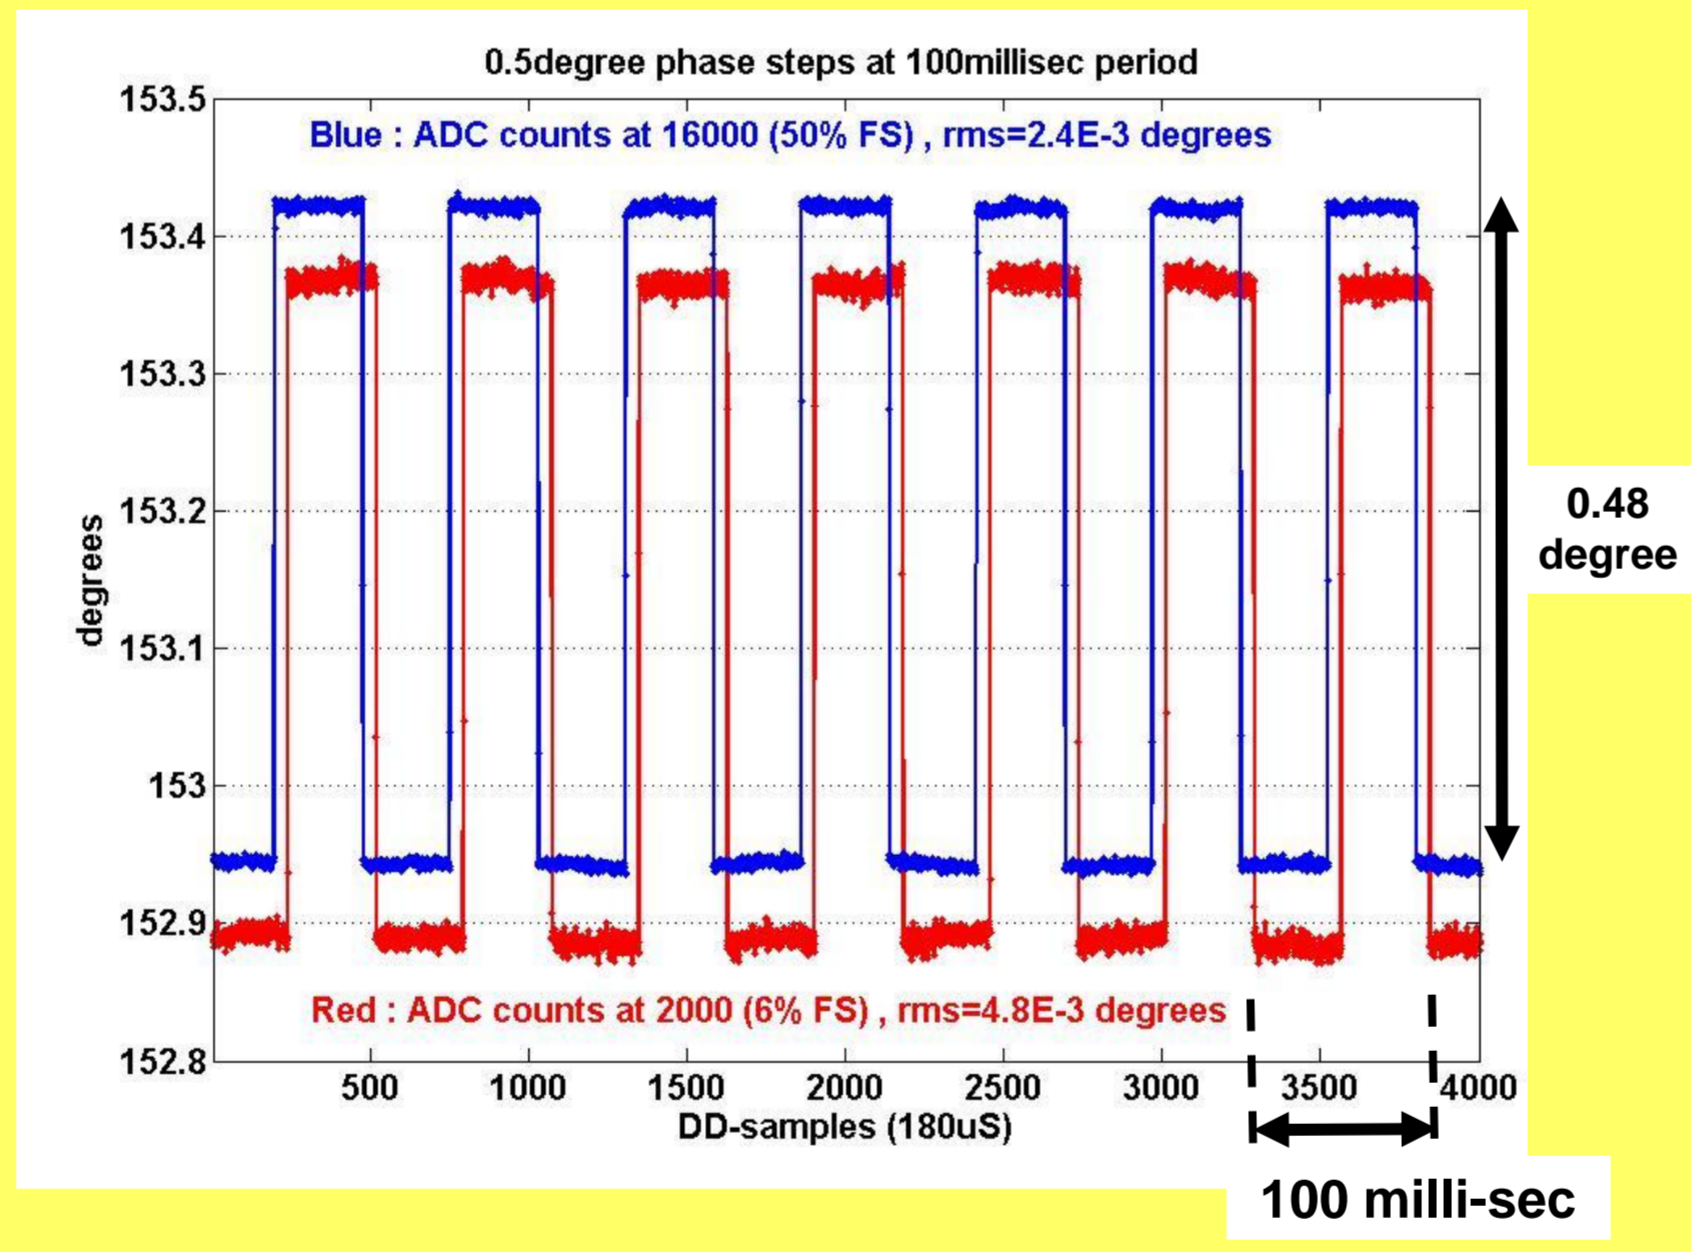

output from DD buffer i.e. 355KHz, T=2.8uS

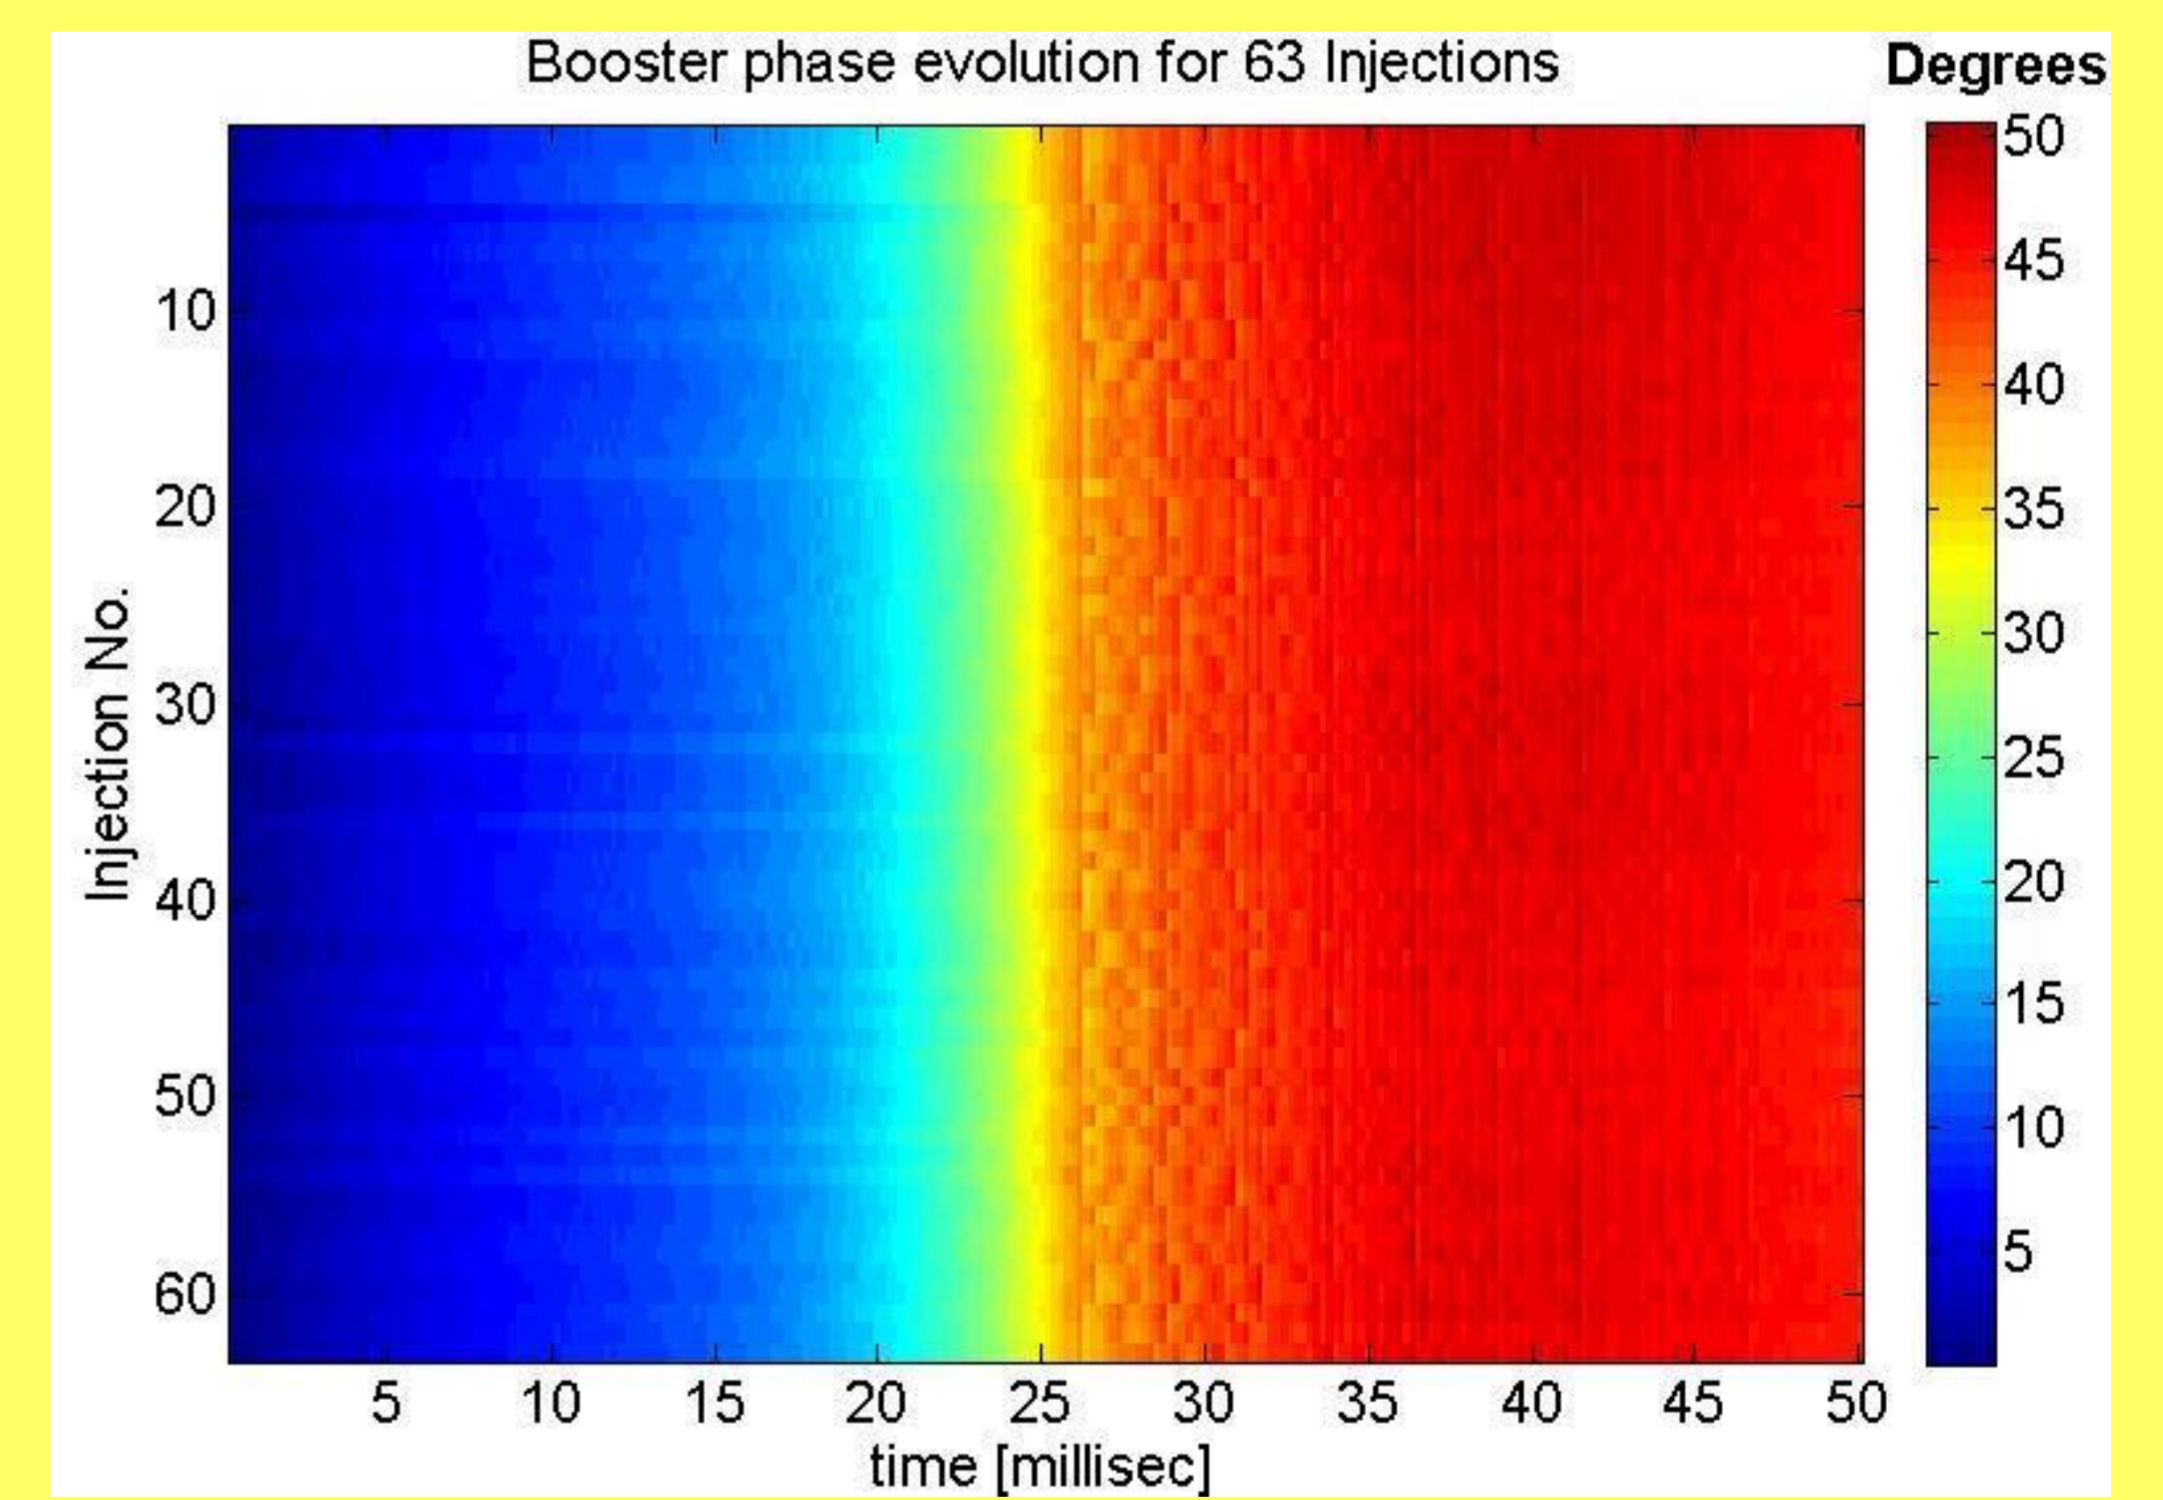

Test Set-Up for tests-measurements with external electronic phase-shifter

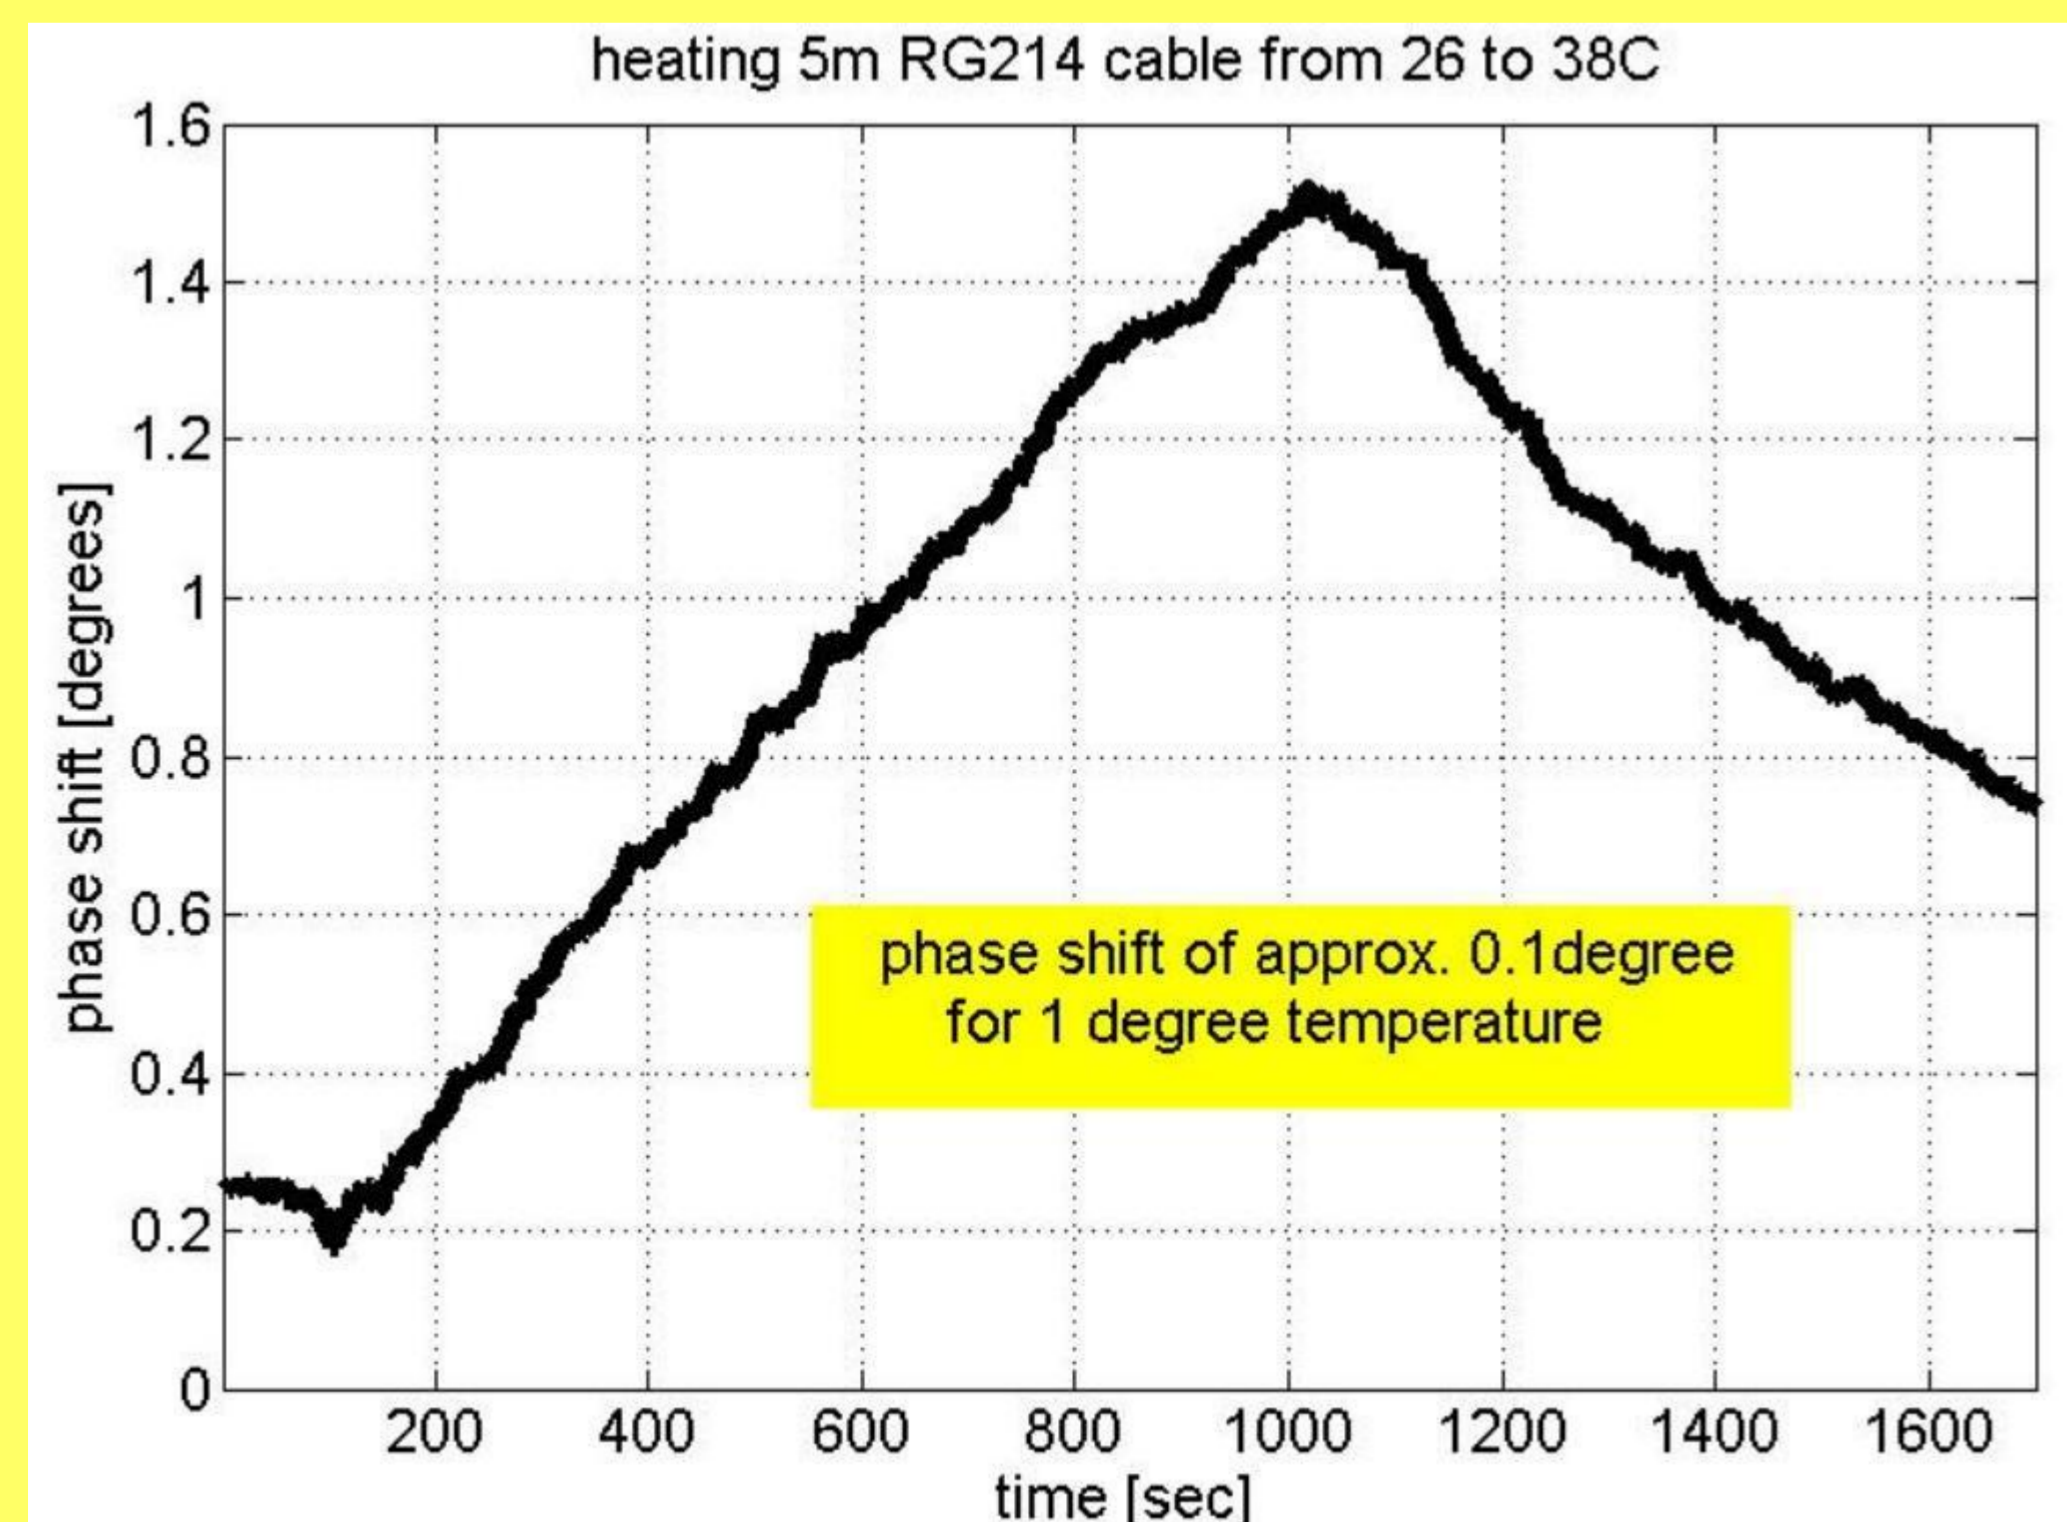

results of phase variations produced by the phase shifter at 100millisec period and 100mV amplitude

output from DD-64 buffer i.e. 5.5KHz, T=180uS

output from DD-64 buffer i.e. 5.5KHz, T=180uS

Libera device is read-out via Tango-device-server and I & Q values then treated by Matlab commands to generate phase values,
typical Matlab commands used :
complex, angle, unwrap and mod
