# Project Goal

- SOLEIL software is based on multiple data sources:
  - Tango
  - NeXus
  - Passerelle models files (i.e sequencer files)
  - Databases
- In the early years of SOLEIL, the software team has been focusing on the control system (Tango) and ATK was fulfilling our needs.
- Today, this is not sufficient. We need to furnish to our java developers a unified API that can be connected to all data sources.

# Solution Outline

Comete Widgets are available in three implementations (Swing, SWT & AWT) and therefore integrate well into your existing software.

Comete is an open three layered architecture.  
Anyone can add a datasource or new widgets.

Connect a widget to a source in 3 lines:

Nexus

- NexusKey key = new NexusKey();
- NexusKeyTool.registerAttribute(key, "myfile", "datasetName");
- chartBox.connectWidget(chartViewer, key);

Widgets (Swing, SWT, AWT)

DataConnection  
Management

DataSources

Tango

- TangoKey key = new TangoKey();
- TangoKeyTool.registerAttribute(key, "mydevice", "attribute");
- chartBox.connectWidget(chartViewer, key);

# Conclusion

- Any contribution, collaboration or comment is welcome
