PLC Based Vacuum Controller Upgrade and Integration at the Argonne Tandem Linear Accelerator System C. Peters, Y. Luo, R. Vondrasek, C. Dickerson, A. Germain, M. Power Argonne National Laboratory, Argonne, IL. USA

Transition From Custom Analog Chassis to Full Programmable Logic Control

For several decades the ATLAS Vacuum Control System has been implemented via in-house custom built hardware chassis utilizing a combination of analog logic circuitry and programmable complex programmable logic devices. There currently exist several different revisions of these chassis depending on their intended purpose. For example, some chassis do not provide a remote vacuum pressure reading and some do not support a separate turbo pump, causing additional effort to integrate into the control system.

Methods	Problem	Solution			
Silk Screen Front Panel	Difficult to modify after changes in machine or device configuration.	Move to digital touchscreens which allows for updating.			

Various Chassis Pump/Gauge Configurations	Each chassis was custom built to handle a specific purpose like Cryostat vacuum or Target Area vacuum stations. With or without Turbo Pumps.	Use a programmable solution to create reusable code blocks for each device and vendor type.
Remote Control and Monitoring	Some chassis have zero monitoring, while others only offer vacuum monitoring, no control.	Select a product which can communicate over a standard TCP/IP Protocol.

Requirements Tracking and Project Management Tools – Fixed Vendors

Publish a fixed list of allowed vacuum equipment and vendors. Published on the Argonne website for Internal and External users.

The final steps of documenting vacuum system requirements was to create a list of devices based on the schematic representation and link them to the desired type of interface. The first four columns document each device in the system and their make and model. Then, the right four columns are used to track each interface method for the PLC.

Reuse Cryogenics Group PLC

The M340 PLCs utilizes Schneider Electric's UnityPro line of software to develop PLC code. Possible programming languages include IEC 61131-3 Ladder Diagram, Structured Text, & Function Block Language. I/O Modules Available: Digital 24V, Analog, RS232/RS485, Thermocouple, SSI

Remote Control via Internet Browser Conclusion

The first application of this new PLC based Vacuum Control System has been installed at ATLAS for the new Electron Beam Ion Source platform. It has been tested to successfully operate valves and some vacuum interlock operations have been verified. Future work will soon include a second project to use PLC controls for a third ion source. By leveraging reuse of vacuum components and associated code, large economies of scale have been realized versus custom hardware. Continuing work has been allocated to the development of a standalone test rack which will include a PLC system, touchscreen MV-9 and a standard vacuum pump configuration of rough pump, turbo, valves, and gauges. This way, further development can take place on an offline system increasing testing speed and reliability.

*This work was supported by the U.S. Department of Energy, Office of Nuclear Physics, under Contract No. DE-AC02-06CH11357. *This research used resources of ANL's ATLAS facility, which is a DOE Office of Science User Facility.
