RF Cavity

1 m => 100 MeV Gain

Electric field < 100 MV/m

Plasma Cavity

1 mm => 100 MeV

Electric field > 100 GV/m

V. Malka *et al.*, Science **298**, 1596 (2002)

How to excite relativistic plasma waves ?

The laser wake field : broad resonance condition $\tau_{\text{laser}} \sim T_p/2$
 \Rightarrow short laser pulse

electron density perturbation and longitudinal wakefield

wave in the wake of a boat

$E_z = 300 \text{ GV/m}$ for 100 %
 Density Perturbation at 10^{19} cc^{-1}

$$v_{\text{phase}}^{\text{epw}} = v_g^{\text{laser}} \sim c$$

T. Tajima and J. Dawson, PRL **43**, 267 (1979)

GeV electron beams from “cm scale” accelerator

4 cm length capillary discharge
310- μm -diameter channel capillary
 $P = 40 \text{ TW}$, density $4.3 \times 10^{18} \text{ cm}^{-3}$
1 GeV, 2.4 % relative energy spread,
30 pC

W. Leemans *et al.*, Nature Physics, september 2006

GeV electron beams from “cm scale” accelerator

Astra Gemini laser RAL :

11J, 55fs, $a=3.9$, 1cm gas jet target, density $5.7 \times 10^{18} \text{ cm}^{-3}$

0.8 GeV, >ten % relative energy spread, 300 pC

S. Kneip et al., Phys. Rev. Lett. 103, 035002 (2009)

IPAC 2013, The 4th International Particle Accelerator Conference, Shanghai China, 12-17 May (2013)

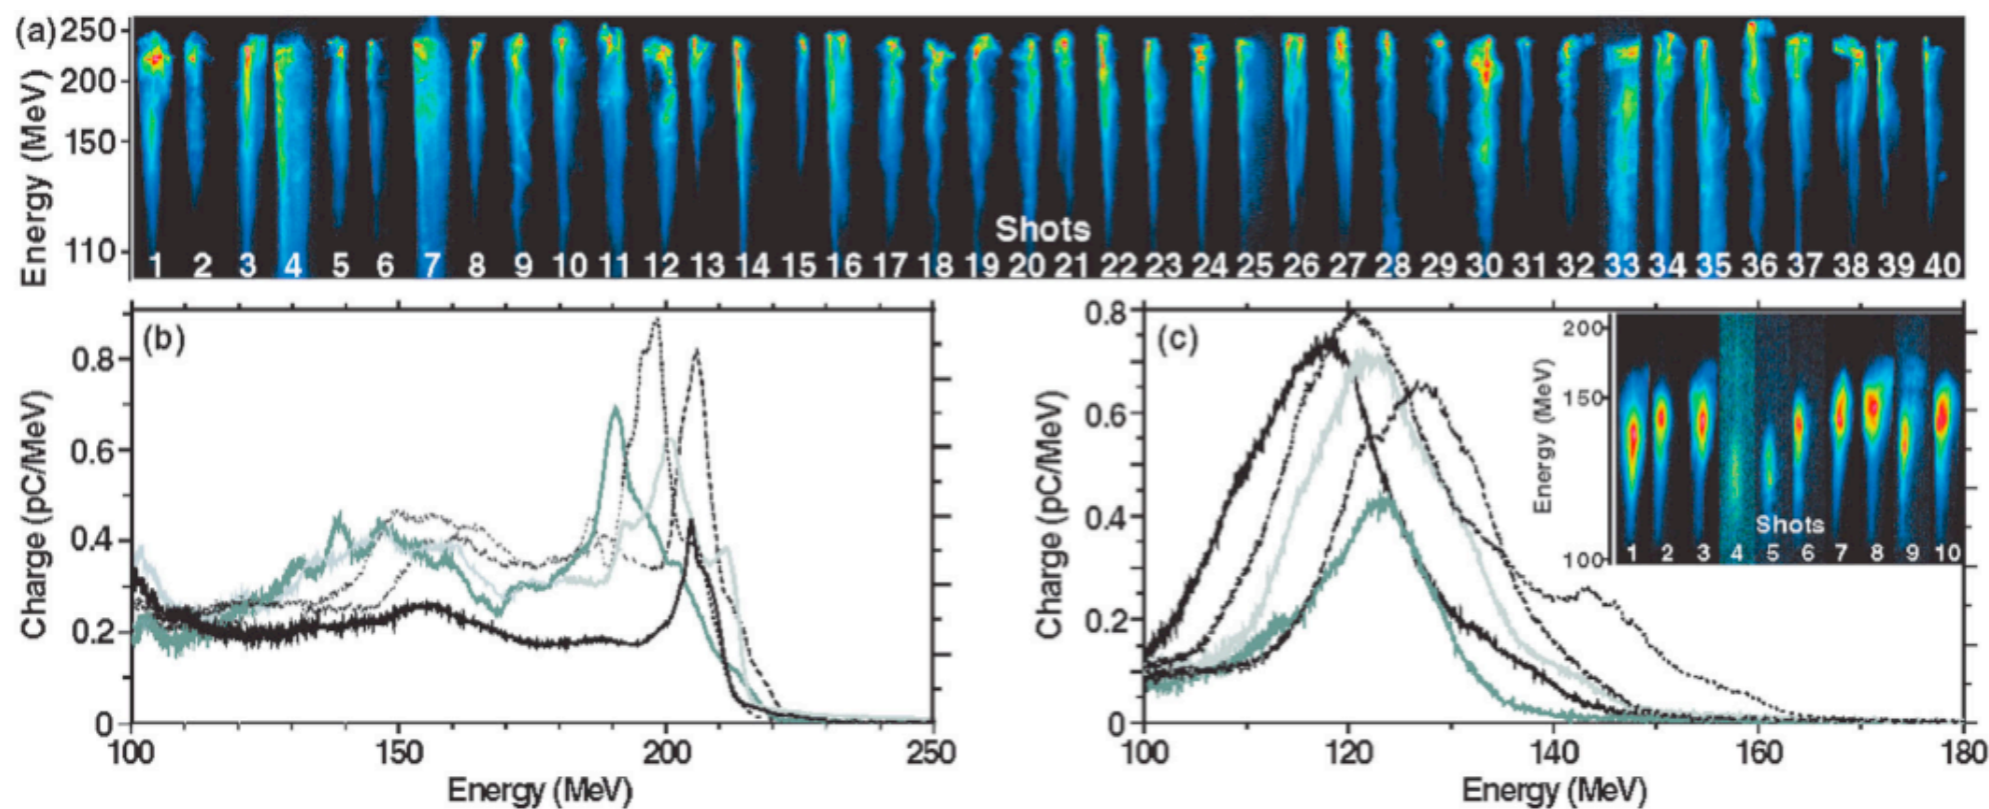

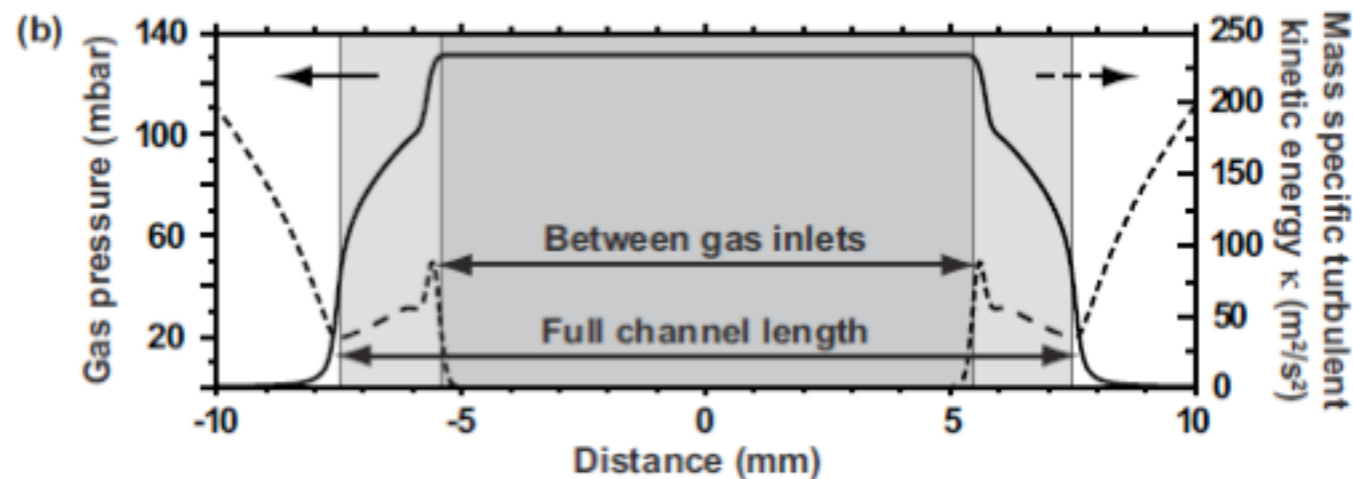

<http://loa.ensta.fr/>

UMR 7639

Gas cell experiments at MPQ

Laser : 20 TW
 1 cm gas cell target
 0.8 J, 40 fs, $a_0=0.9$
 $n_e=7 \times 10^{18} \text{ cm}^{-3}$
 Stable e-beam :
 10 pC
 220 MeV
 Div = 2 mrad
 DE/E = 8%

J. Osterhoff et al., PRL 101, 085002 (2008)

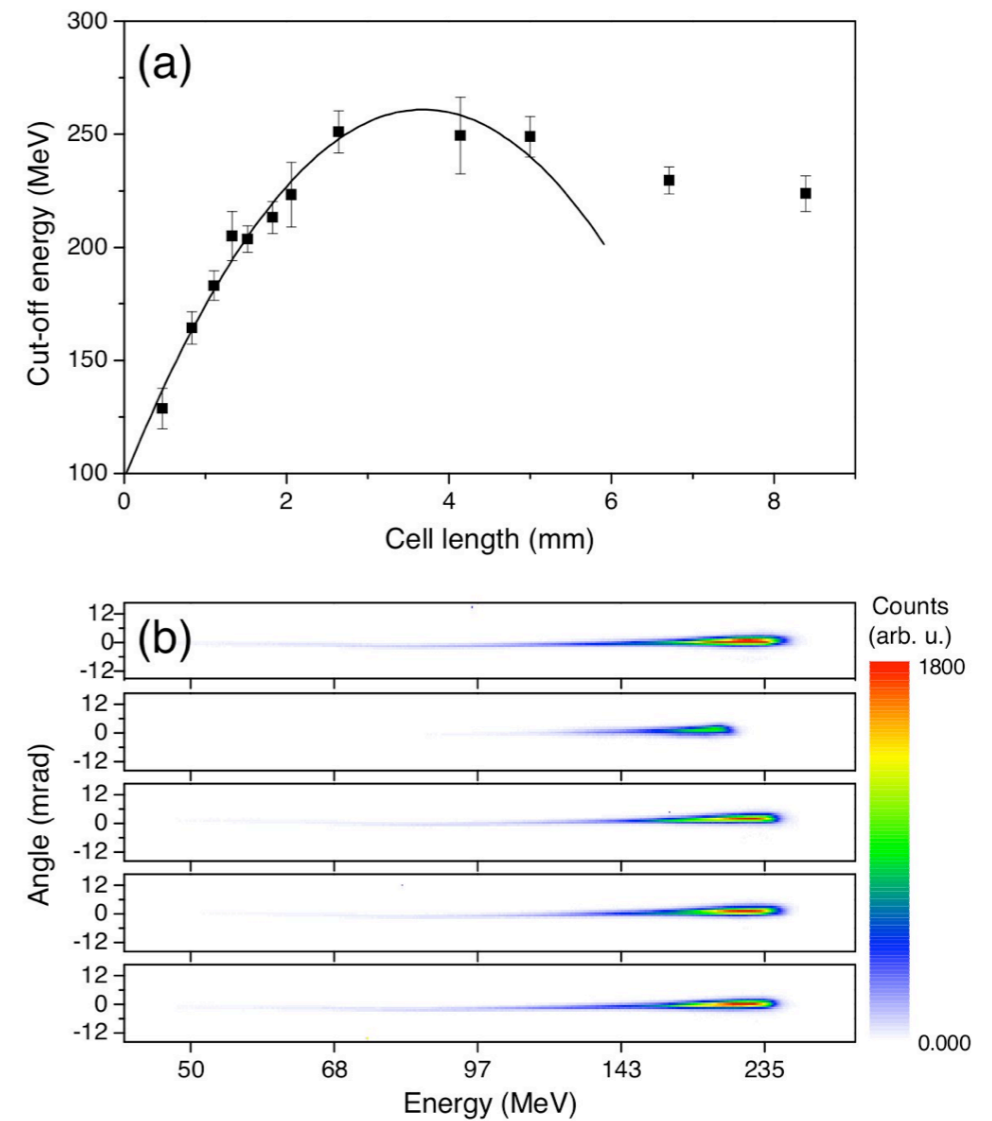

Longitudinal injection

Two different self-injection mechanisms take place :
• At lower plasma density transverse injection is prevented
• Only one bunch is injected (longitudinal injection)

longitudinal injection improves
- the stability of the electron beam
and
- reduces the divergence of the electron beam

S. Corde et al., Nature Communications (2013)

IPAC 2013, The 4th International Particle Accelerator Conference, Shanghai China, 12-17 May (2013)

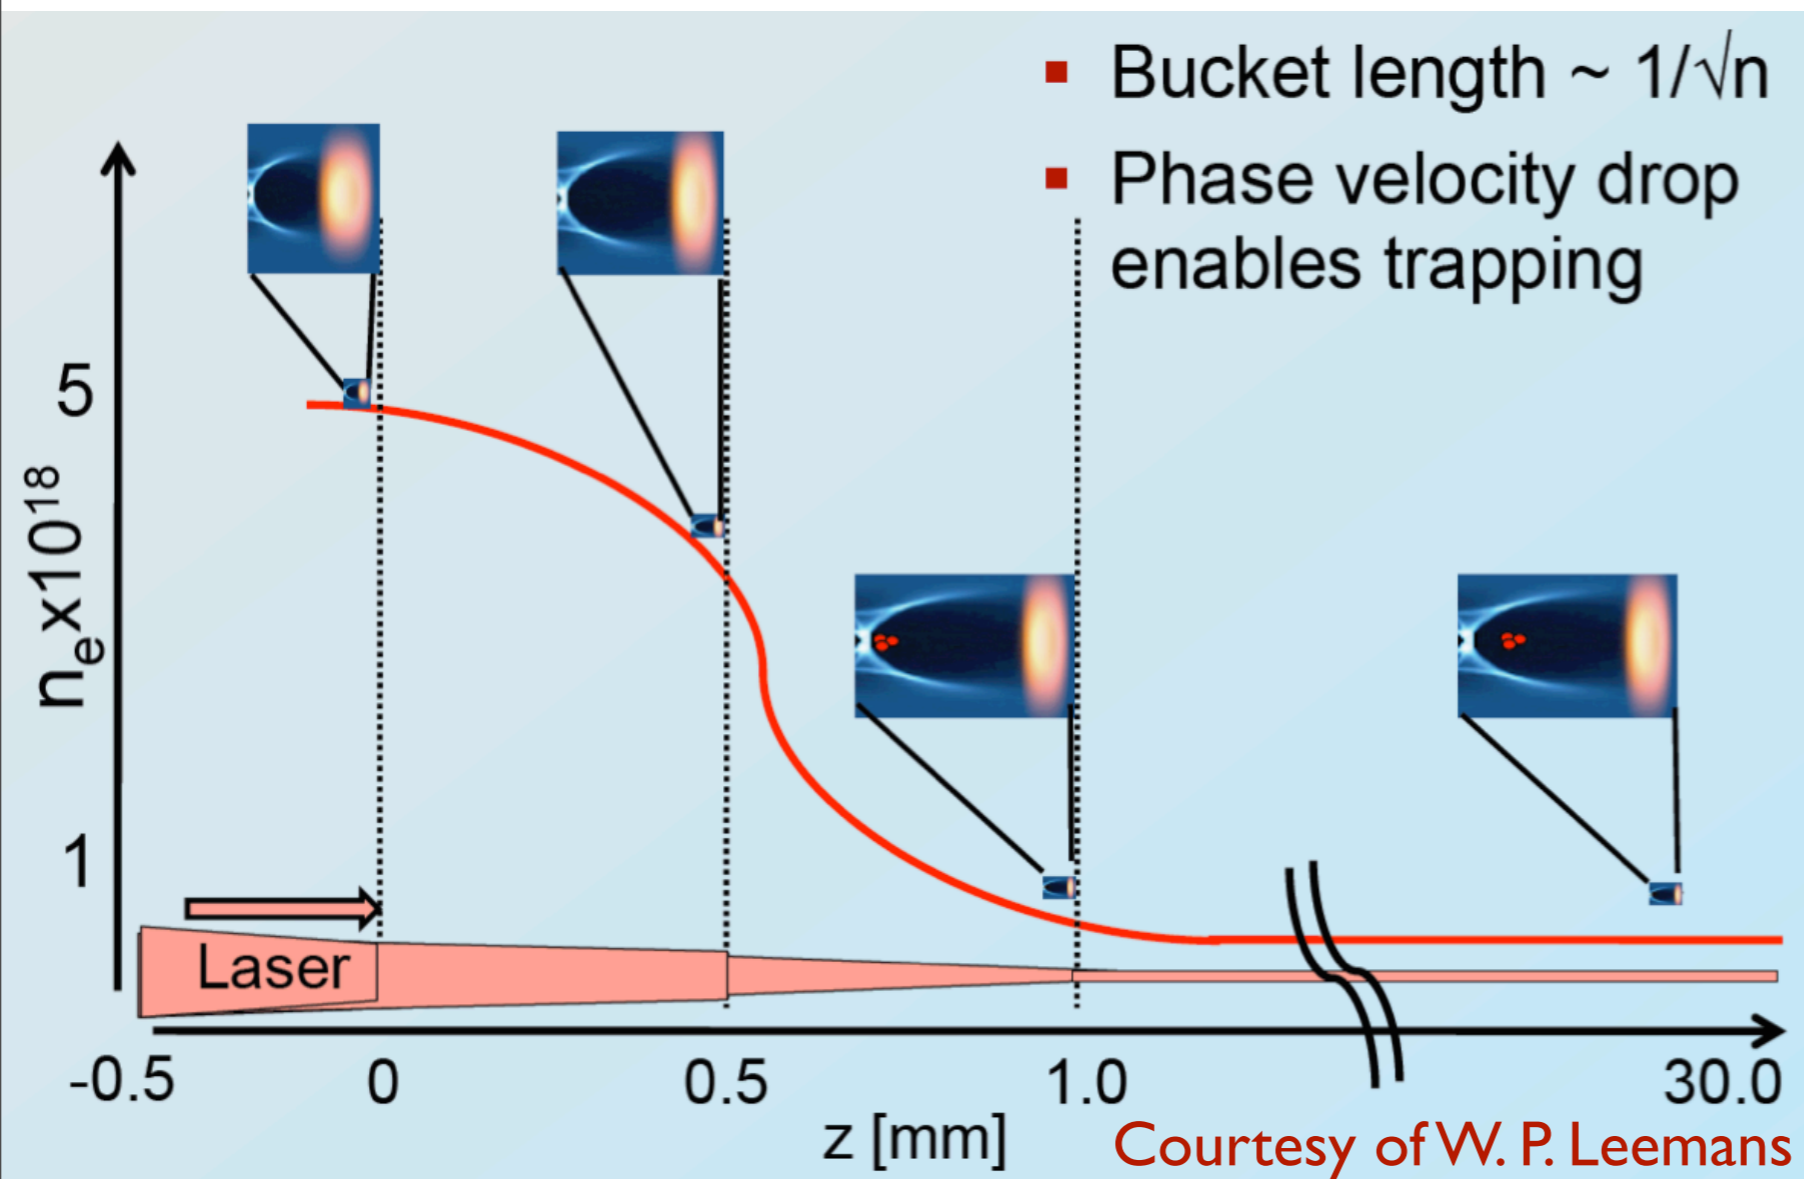

UMR 7639

<http://loa.ensta.fr/>

Density ramp injection : principle

$$v_p/c = \left(1 + \frac{\zeta}{k_p} \frac{dk_p}{dz}\right)^{-1}$$

where, $\zeta = z - ct$ and $k_p(z)$

which depends on z through on density

$$\frac{k_p}{dz} = \frac{k_p}{2n_e} \frac{dn_e}{dz}$$

For a downward density, the wake phase velocity slow down facilitating electrons trapping

S. Bulanov *et al.*, PRE **58**, R5257 (1998), H. Suk *et al.*, PRL **86**, 1011 (2001), T.-Y Chien *et al.*, PRL **94**, 115003 (2005), T. Hosokai *et al.*, PRL **97**, 075004 (2006), C. G. R. Geddes *et al.* PRL **100**, 215004 (2008), J. Faure *et al.*, Phys. of Plasma **17**, 083107 (2011)

UMR 7639

Inverse Compton Scattering

Doppler upshift : high energy photons with modest electrons energy : $\omega_x = 4\gamma^2 \omega_0$

For example : 20 MeV electrons can produce 10 keV photons
200 MeV electrons can produce 1 MeV photons

The number of photons depends on the electron charge N_e and a_0^2 : $N_x \propto a_0^2 \times N_e$

Duration (fs), source size (μm) = electron bunch length and electron beam size

Spectral bandwidth : $\Delta E/E \propto 2\Delta\gamma/\gamma, \gamma^2\Delta\theta^2$

Inverse Compton Scattering : New scheme

A single laser pulse

A plasma mirror reflects the laser beam

The back reflected laser collides with the accelerated electrons

No alignment : the laser and the electron beams naturally overlap

Save the laser energy !

Inverse Compton Scattering : Compton Spectra

- About 10^8 ph/shot, a few 10^4 ph/shot/0.1%BW @ 100 keV
- Broad electron spectrum => broad X ray spectra
- Brightness: 10^{21} ph/s/mm²/mrad²/0.1%BW @100 keV

K.Ta Phuoc *et al.*, Nature Photonics **6** (2012)

Some examples of applications : radiotherapy

simulations of prostate cancer with 7 irradiation beams

250 MeV electrons

X rays IMRT

A comparison of dose deposition with 6 MeV X ray an improvement of the quality of a clinically approved prostate treatment plan. While the target coverage is the same or even slightly better for 250 MeV electrons compared to photons the dose sparing of sensitive structures is improved (up to 19%).

- Review of injection processes :
 - Transverse injection : Bubble/Blow out regime
 - Longitudinal injection
 - Density gradient
 - Ionization
 - Colliding
- Applications
- **Conclusion and perspectives**

Accelerators point of view :

Good beam quality & Monoenergetic dE/E down to 1 %

Beam is very stable

Energy is tunable: up to 400 MeV

Charge is tunable: 1 to tens of pC

Energy spread is tunable: 1 to 10 %

Ultra short e-bunch : 1,5 fs rms

Low divergence : 2 mrad

Low emittance¹⁻³ : $< \pi$.mm.mrad

With PW class laser : peak energy at 3 GeV

New ideas for controlling the injection ?

Cold injection scheme¹

Magnetic control of injection²

Control phase of the electric field³

Transverse injection scheme⁴...

New numerical code/scheme for long accelerating distance runs ?

Boost Frame, Fourier decomposition codes, moving frames

New schemes to reduce artificial cerenkov effect and/or emittance growth, etc..

New diagnostics ?

New diagnostics such as betatron^{4,5}, magnetic field^{6,7}, interferometry in the frequency-time⁸, etc...
