# **Overview of Accelerator Timing Systems**

Javier Serrano

CERN BE-CO-HT

March 30, 2011

Timing technologies

Conclusions

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ○ ○ ○

# Goals of this presentation

#### In scope

- How to distribute a common notion of time to many nodes.
- Usual timing performance specification methods.
- Existing technologies for different performance goals.

### Out of scope

- A detailed survey of all deployed solutions.
- How to use event systems to sequence accelerator operation.

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ○ ○ ○

### Timing concepts

- Background on phase noise
- Background on phase-locked loops

## **Timing technologies**

- Millisecond timing
- Microsecond timing
- Nanosecond and picosecond timing
- Femtosecond timing

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ○ ○ ○

# Outline

## Timing concept

- Background on phase noise
- Background on phase-locked loops

## 3 Timing technologies

- Millisecond timing
- Microsecond timing
- Nanosecond and picosecond timing
- Femtosecond timing

# General background

### Why timing systems

- Having many systems act in sync.
- Providing a common notion of time to make sense of distributed diagnostics data.

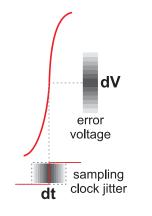

### Challenges

- Generating a very good (periodic) clock signal at the source.
- Evaluating transmission delay from that source to each destination so we can account for it.

Timing technologies

Conclusions

### An example application Clocking an ADC from a recovered clock signal in a timing receiver

Clock jitter becomes amplitude noise in the sampled signal, with a conversion factor depending on signal slope.

## The imperfect sine wave

### With both amplitude and phase noise

$$a(t) = A(1 + \alpha(t))\sin(\omega t + \varphi(t))$$

If we use hard-limiters, AGCs, etc.

$$a(t) = A\sin\left(\omega\left(t + \frac{\varphi(t)}{\omega}\right)\right)$$

Conclusions

## Phase noise Power Spectral Density (PSD)

### Parseval's theorem

$$\int_{-\infty}^{+\infty} |\varphi(t)|^2 dt = \int_{-\infty}^{+\infty} |\Phi(f)|^2 dt$$

### Truncated signal

$$\Phi_T(f) = \int_{-T/2}^{+T/2} \varphi_T(t) e^{-j2\pi f t} dt$$

#### **Truncated Parseval**

$$\frac{1}{T}\int_{-T/2}^{+T/2}|\varphi_{T}(t)|^{2} dt = \int_{-\infty}^{+\infty}\frac{|\Phi_{T}(t)|^{2}}{T}dt$$

## Phase noise Power Spectral Density (PSD)

### Wiener-Khintchine theorem

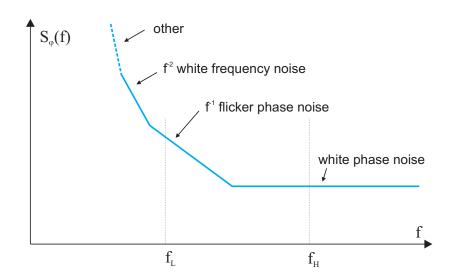

$$S_{\varphi}^{\prime\prime}(f) = \lim_{T \to \infty} \frac{1}{T} |\Phi_T(f)|^2$$

#### In practice

$$S_{\varphi}(f) pprox rac{2}{T} \left< |\Phi_T(f)|^2 \right>_m$$

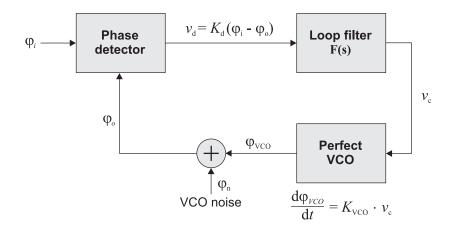

Timing technologies

## PLL transfer functions

### Total output phase spectrum

$$\Phi_o(s) = H(s) \cdot \Phi_i(s) + E(s) \cdot \Phi_n(s)$$

### System transfer function (low pass)

 $H(s) = rac{K_{VCO}K_dF(s)}{s + K_{VCO}K_dF(s)}$ 

### Error transfer function (high pass)

$$E(s) = 1 - H(s) = \frac{s}{s + K_{VCO}K_dF(s)}$$

# Outline

## Timing concepts

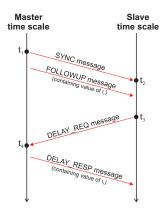

- Background on phase noise
- Background on phase-locked loops

## 3 Timing technologies

- Millisecond timing
- Microsecond timing
- Nanosecond and picosecond timing
- Femtosecond timing

Conclusions

## Two-way delay compensation schemes

Having the values of  $t_1$ ,  $t_2$ ,  $t_3$  and  $t_4$ , the slave can calculate the one-way link delay:

$$\delta_{ms} = \frac{(t_4 - t_1) - (t_3 - t_2)}{2}$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ○ ○ ○

Timing technologies

### Millisecond timing Example: Network Time Protocol (NTP)

### Used in general-purpose computers

- Works across the Internet.
- Each client (slave) gets synchronized to one or more servers.

### Cannot do better than 1 ms

- Asymmetries in network, switches and routers.
- Non-determinism due to OS scheduler (time tags done in SW).
- Requires strong statistics artillery to average over many measurements.

Timing technologies

Conclusions

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ○ ○ ○

### Microsecond timing Example: Precision Time Protocol (PTP, IEEE1588)

## Acts on both of NTP's shortcomings

- Time-tagging can be done in HW.
- Special PTP switches ensure no loss in precision.

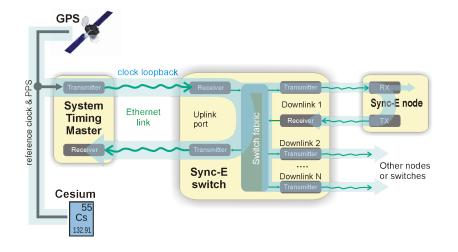

### Has a hard time doing better than $1\mu s$

- Typical nodes use a free-running oscillator.
- Frequency offset (and drift) compensation generates extra traffic.

Timing technologies

Conclusions

### Nanosecond and picosecond timing Example: Synchronous Ethernet

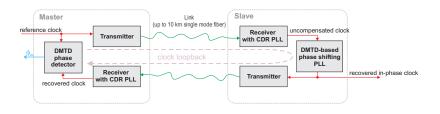

Timing technologies

Conclusions

▲ロト ▲周 ト ▲ ヨ ト ▲ ヨ ト ・ シ へ ○ ヘ

### Nanosecond and picosecond timing Phase tracking

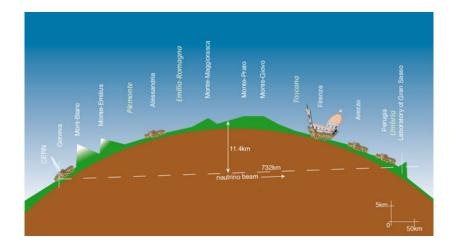

- Monitor phase of bounced-back clock continuously.
- Phase-locked loop in the slave follows the phase changes measured by the master.

Timing technologies

Conclusions

### Nanosecond and picosecond timing Another example: neutrino oscillation experiments

# Conclusions

### Specify well

Jitter (with PSD integration limits), UTC vs. beam-synchronous, automatic delay compensation...

#### Choose well

Going from milliseconds to femtoseconds has costs (money, complexity, reliability...). Pick the technology which suits your needs best.
