

# Present Status of NICA Project

*Alexander Smirnov, JINR, Dubna, Russia*  
on behalf of NICA team

# NICA Physics case. QCD phase diagram

**Deconfinement matter (high  $\epsilon, T, n_B$ ):**  
 $\epsilon > 1 \text{ GeV}/\text{fm}^3, T > 150 \text{ MeV}, n_B > (3-5)n_0$

The most intriguing and little studied region of the QCD phase diagram:

- Characterized by the highest net baryon density
- Allows to study in great detail properties of the phase transition region
- Has strong discovery potential in searching for the **Critical End Point** and manifestation of **Chiral Symmetry Restoration**

Recently became very attractive for heavy-ion community:

**RHIC/BNL, SPS/CERN, FAIR/GSI, NICA/JINR**

<http://theor.jinr.ru/twiki-cgi/view/NICA/WebHome>

**Challenge:** comprehensive experimental program requires scan over the QCD phase diagram by varying collision parameters: system size, beam energy and collision centrality

# The goal of the project is

construction at JINR of a new accelerator facility, that provides

1a) Heavy ion colliding beams  $^{197}\text{Au}^{79+} \times ^{197}\text{Au}^{79+}$  at

$\sqrt{s_{\text{NN}}} = 4 \div 11 \text{ GeV}$  (1  $\div$  4.5 GeV/u ion kinetic energy )

at  $L_{\text{average}} = 1\text{E}27 \text{ cm}^{-2}\cdot\text{s}^{-1}$  (at  $\sqrt{s_{\text{NN}}} = 9 \text{ GeV}$ )

1b) Light-Heavy ion colliding beams of the same energy range and luminosity

2) Polarized beams of protons and deuterons in collider mode:

$p\uparrow p\uparrow \sqrt{s_{\text{pp}}} = 12 \div 27 \text{ GeV}$  (5  $\div$  12.6 GeV kinetic energy )

$d\uparrow d\uparrow \sqrt{s_{\text{NN}}} = 4 \div 13.8 \text{ GeV}$  (2  $\div$  5.9 GeV/u ion kinetic energy )

$L_{\text{average}} \geq 1\text{E}30 \text{ cm}^{-2}\cdot\text{s}^{-1}$  (at  $\sqrt{s_{\text{pp}}} = 27 \text{ GeV}$ )

3) The beams of light ions and polarized protons and deuterons for fixed target experiments:

$\text{Li} \div \text{Au} = 1 \div 4.5 \text{ GeV /u}$  ion kinetic energy

$p, p\uparrow = 5 \div 12.6 \text{ GeV}$  kinetic energy

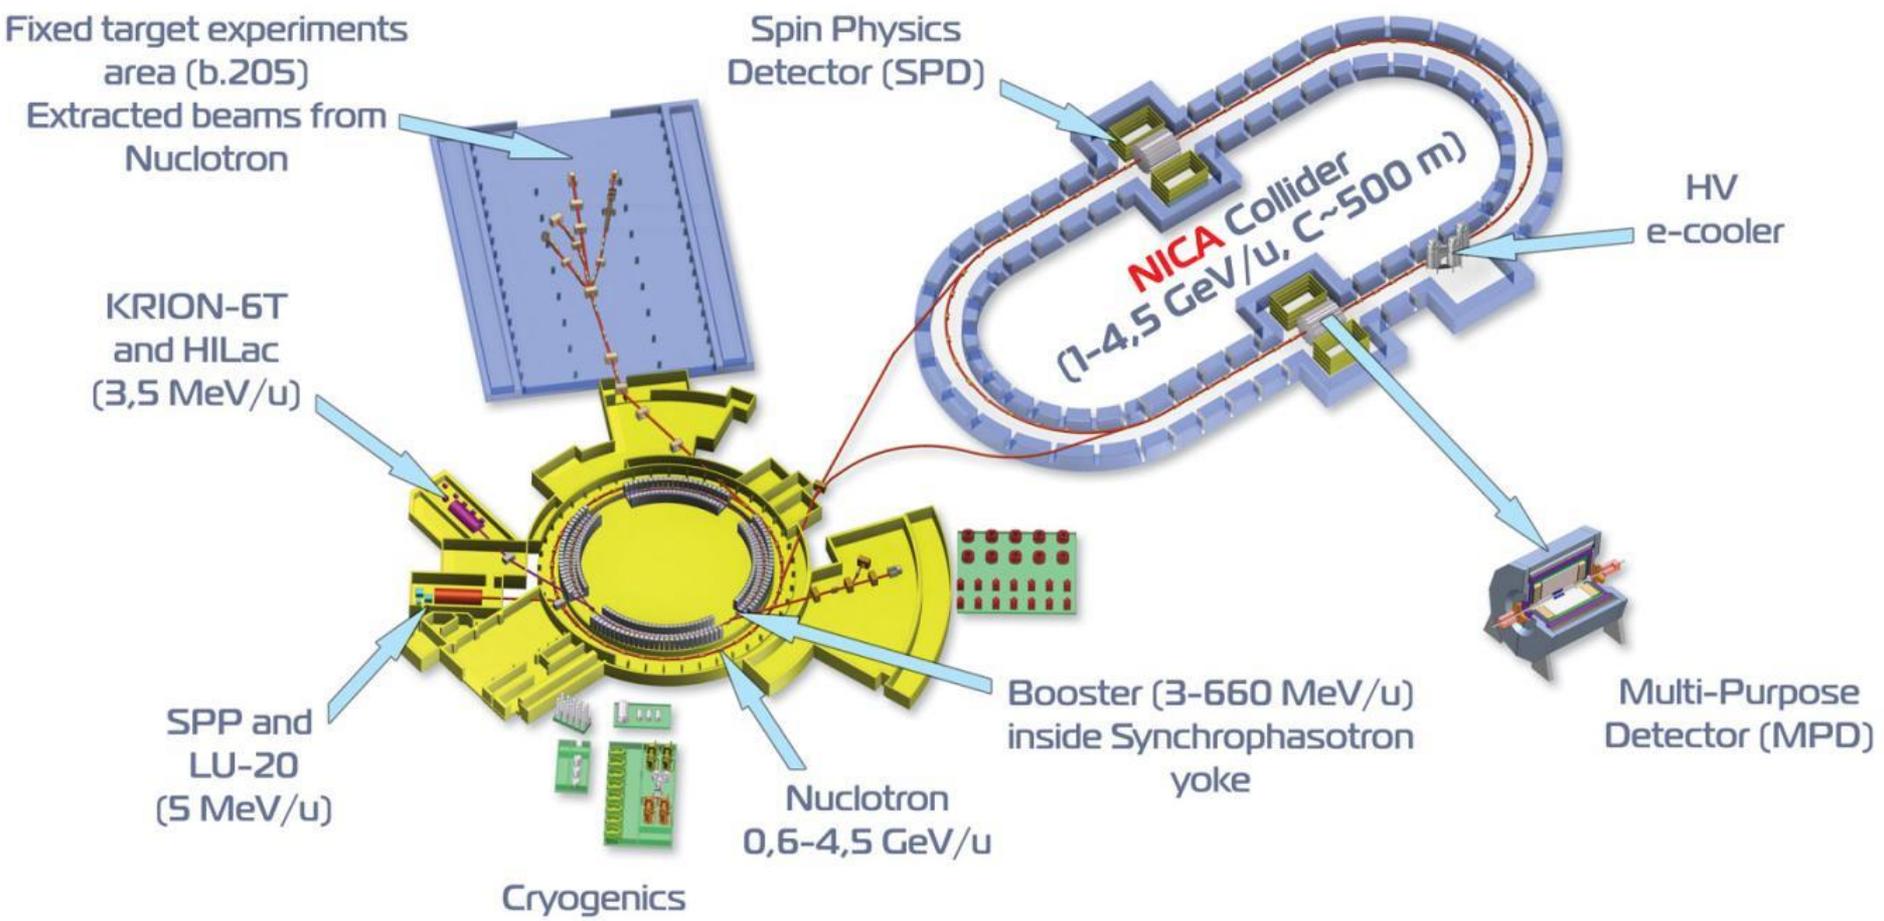

$d, d\uparrow = 2 \div 5.9 \text{ GeV/u}$  ion kinetic energy

4) Applied research on ion beams at kinetic energy from 0.5 GeV/u

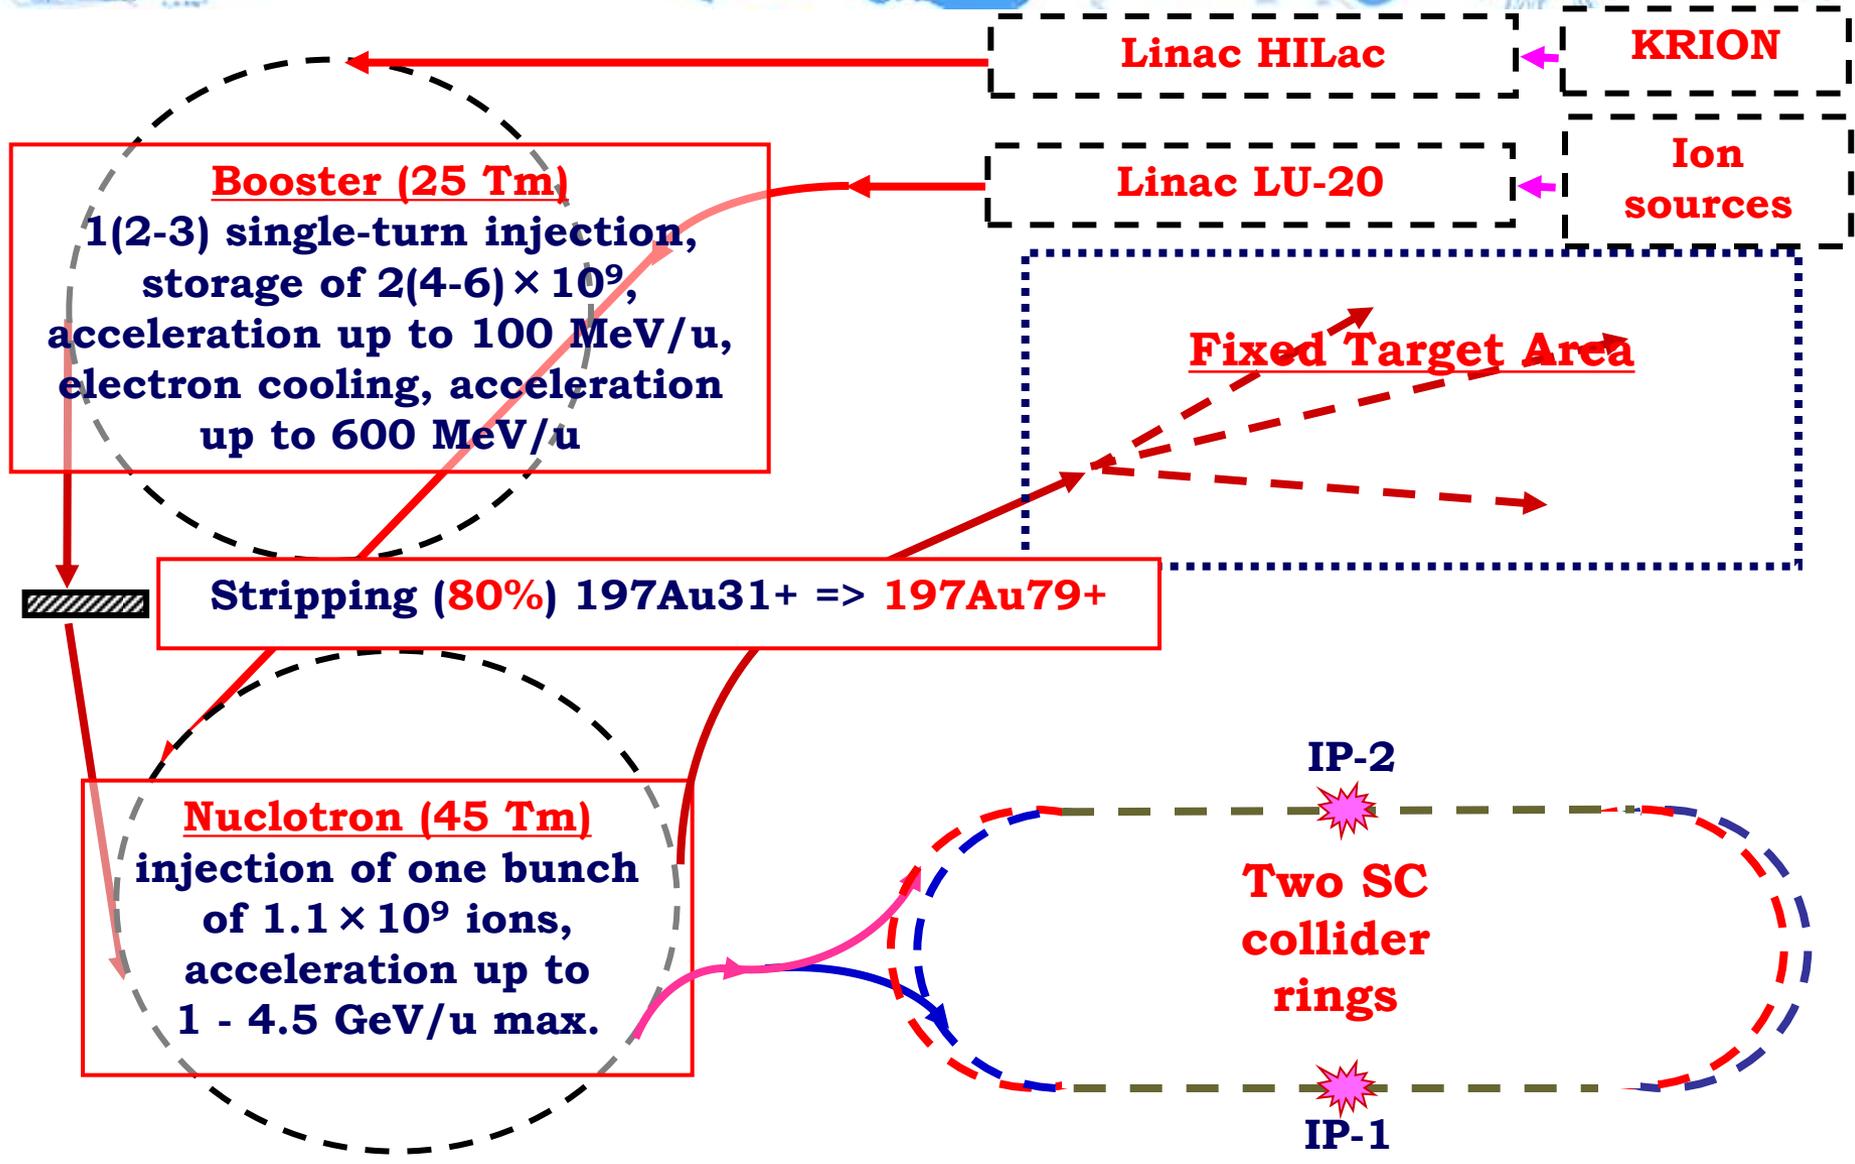

up to 12.6 GeV (p) and 4.5 GeV /u (Au)

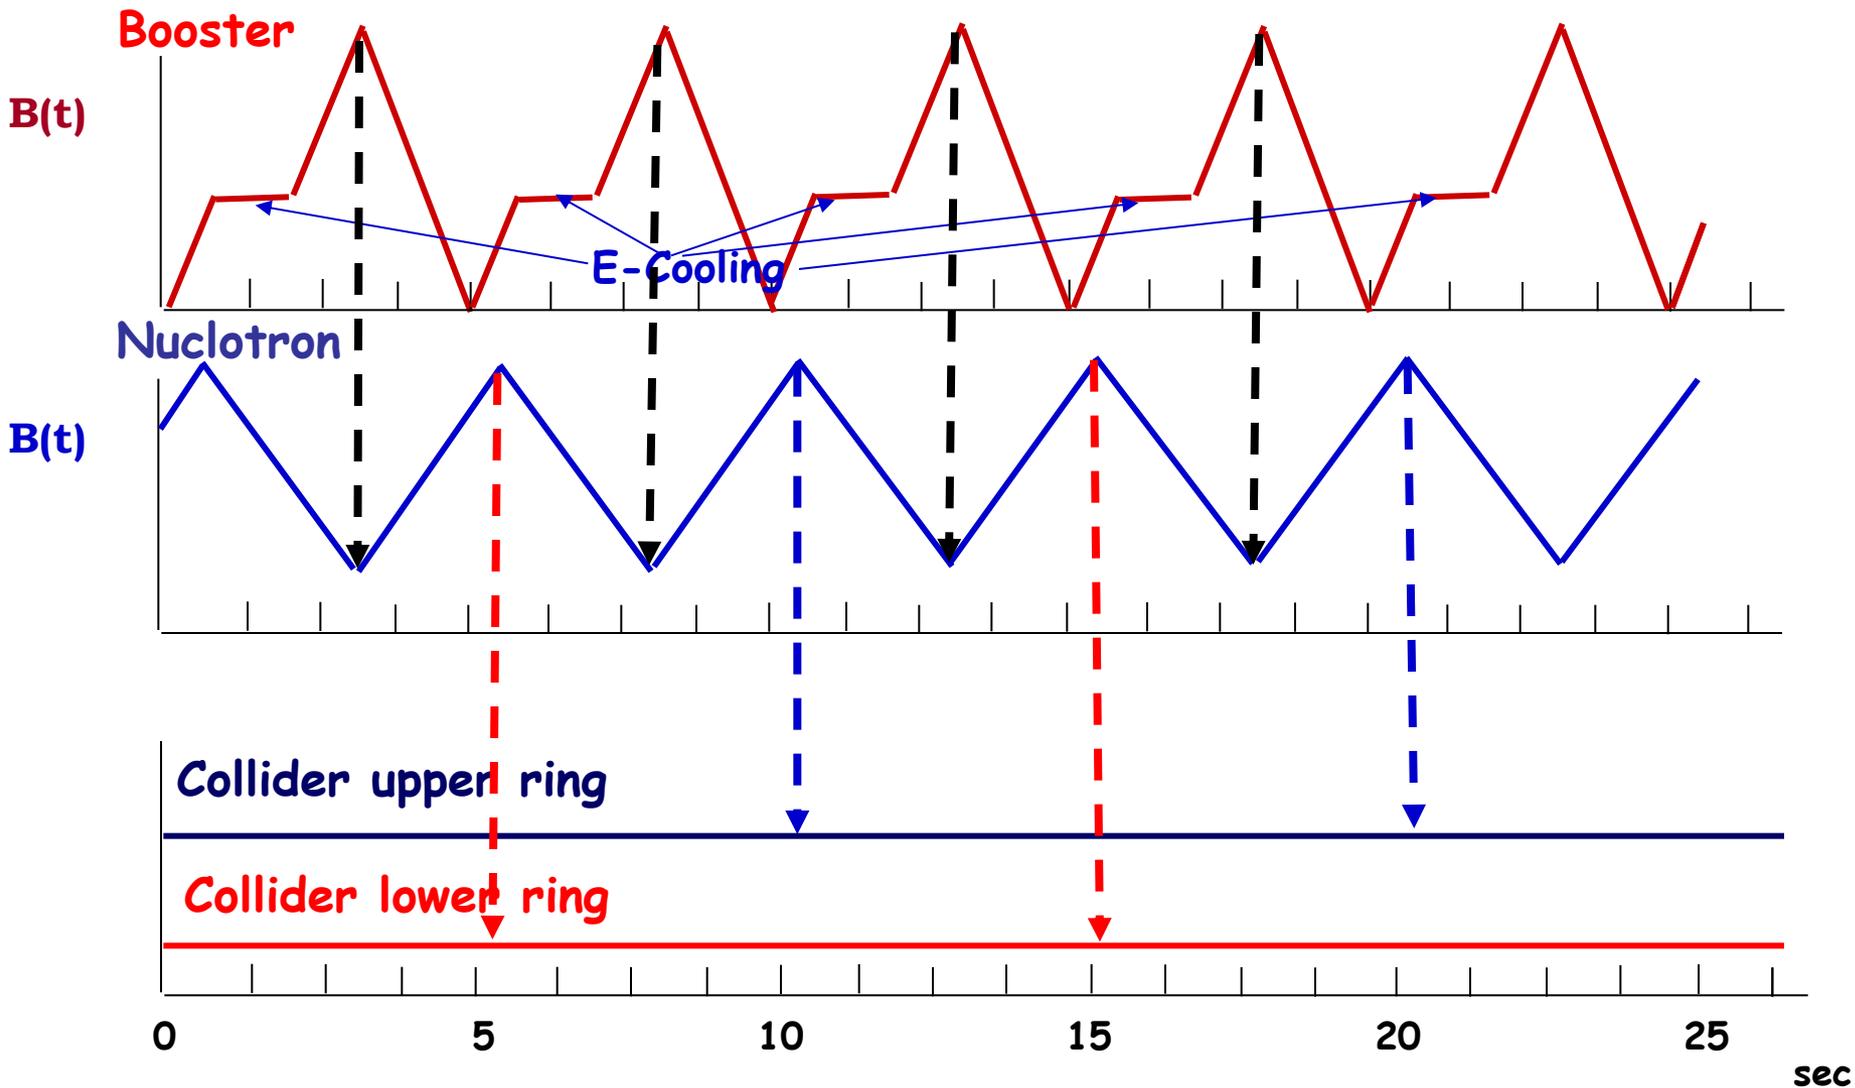

# Superconducting accelerator complex **NICA** (**N**uclotron based **I**on **C**ollider **f**acility)

# Facility Scheme and Operation Scenario

# Facility structure and operation regimes

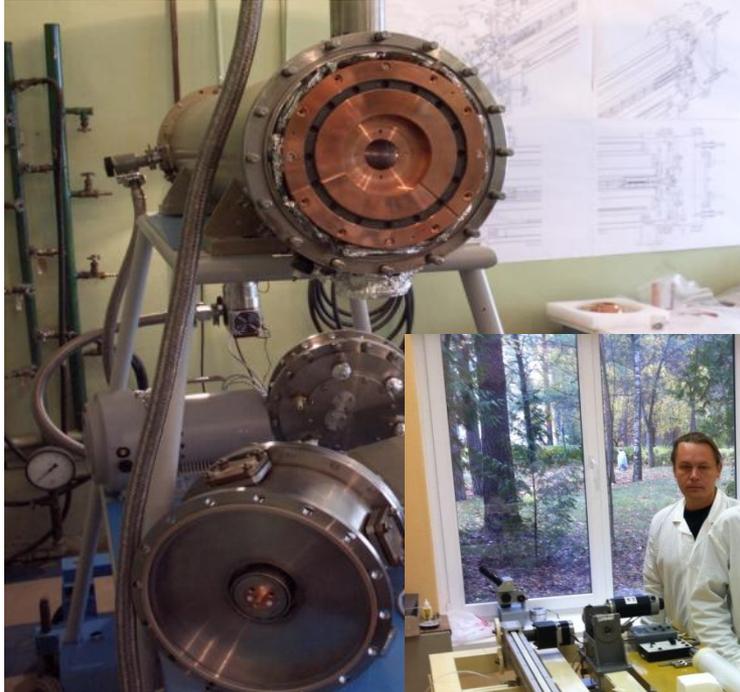

# Injection Chain and Beam Parameters

Acceleration stage	Energy, MeV/u	N, $10^9$	$\varepsilon, \pi$ mm mrad	$\sigma_p$	$\sigma_s, m$
Injection from HILac Acceleration in the Booster at 5-th harmonics	3.2	2	Depending of injection scheme		
After cooling in the Booster	65	1.5	0.73	$6.6 \cdot 10^{-5}$	C*
After acceleration in the Booster at 1-st harmonics	578	1.35	0.24	$3.1 \cdot 10^{-4}$	8.5
At injection into the Nuclotron	572	1.1	0.72	$4.1 \cdot 10^{-4}$	8.5
After acceleration in the Nuclotron	1000	1	0.55	$3.6 \cdot 10^{-4}$	8
	3000	1	0.24	$1.7 \cdot 10^{-4}$	8
	4500	1	0.18	$1.2 \cdot 10^{-4}$	8

# Heavy Ion Source KRION-6T

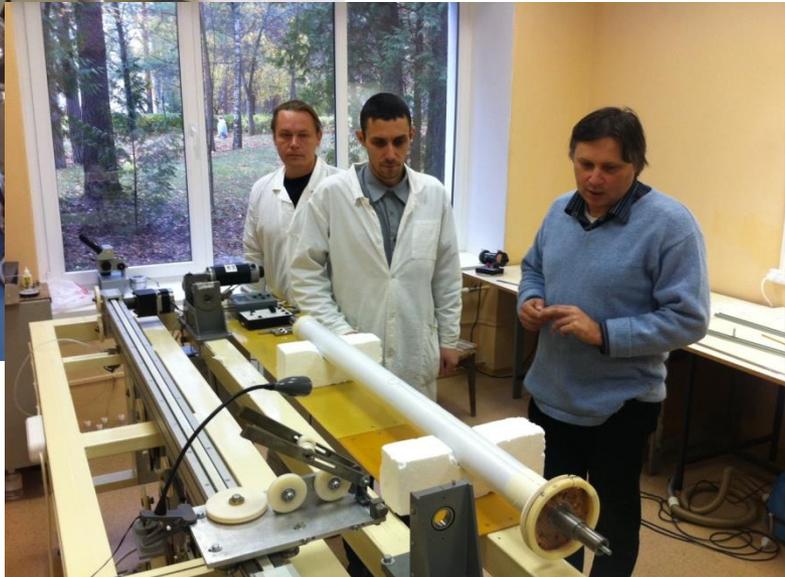

Assembling of electron/ion optics system: view from the “ion extraction” side.

Solenoid magnetic field of 5.45 Tesla has reached during the test in November 2012

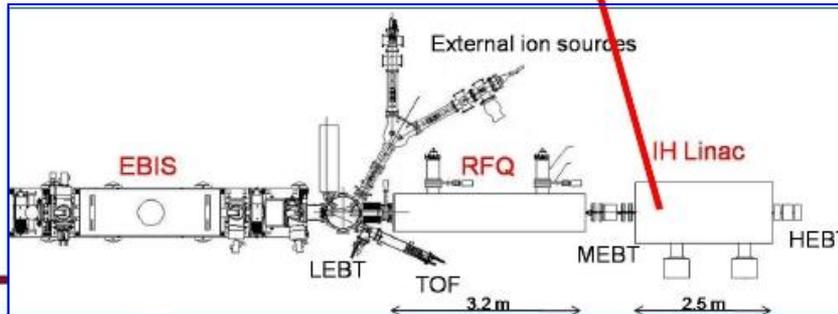

*E.E.Donets*  
*E.D.Donets*

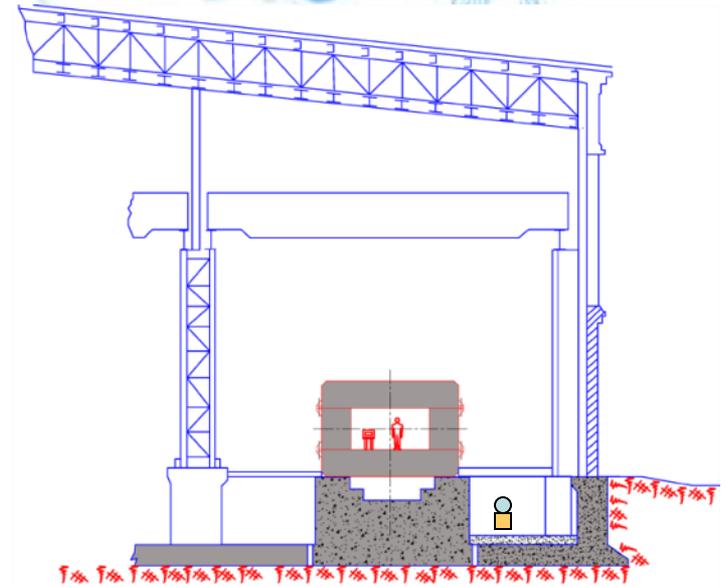

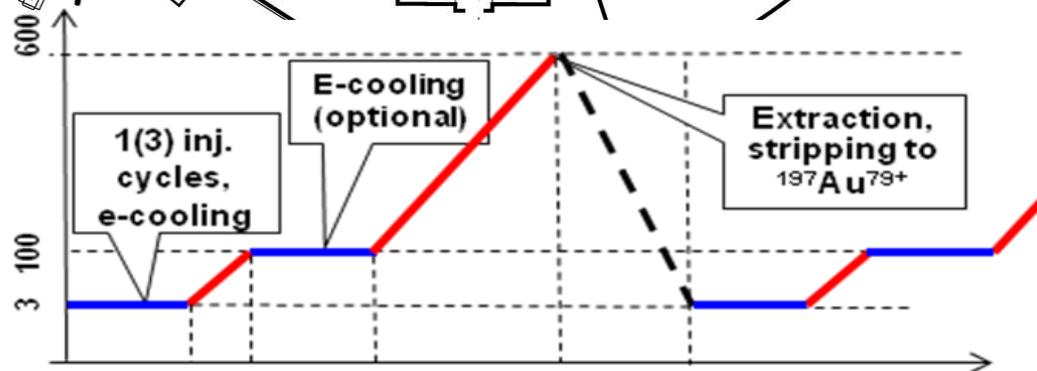

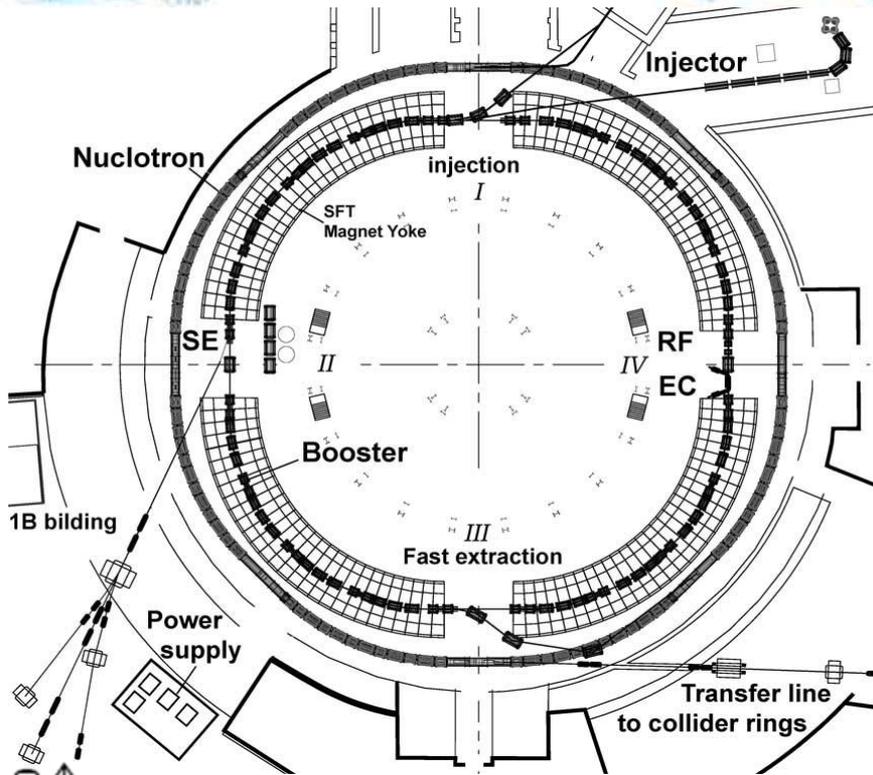

6T solenoid is under test now

# Heavy Ion LINAC (HILAC)

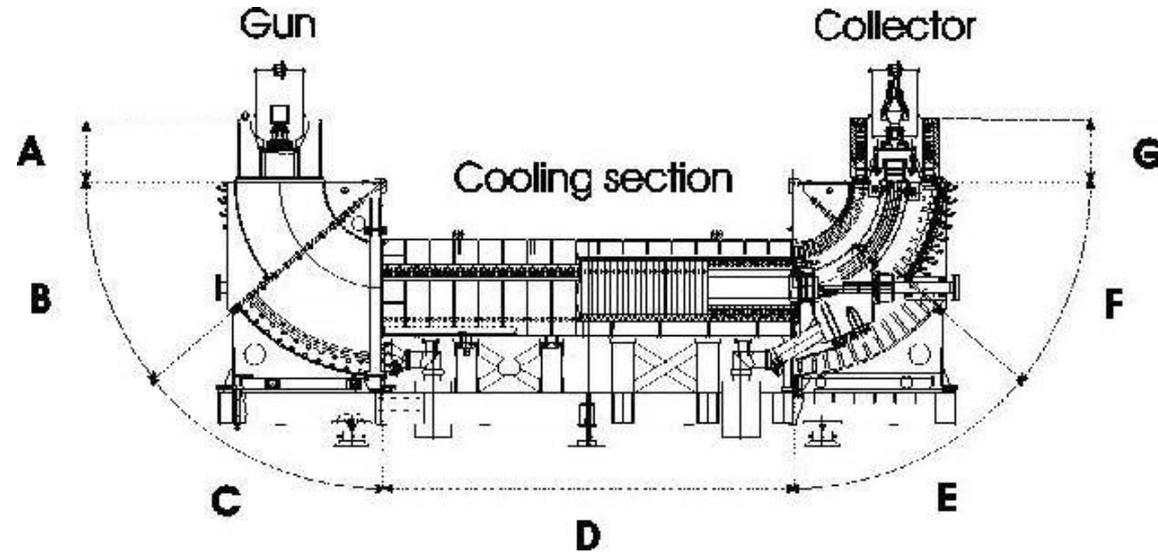

**HILAC (3 MeV/u) delivery from BEVATECH (Frankfurt) is planned for April 2013.**

# Booster synchrotron, C=211 m

# Electron cooling system for the Booster

**CDR has been completed by BINP in 2012, beginning of technical design at BINP and manufacturing there - 2013**

**Agreement with Budker INP (Novosibirsk): common design, the main part will be constructed at BINP (V.Parkhomchuk and team)**

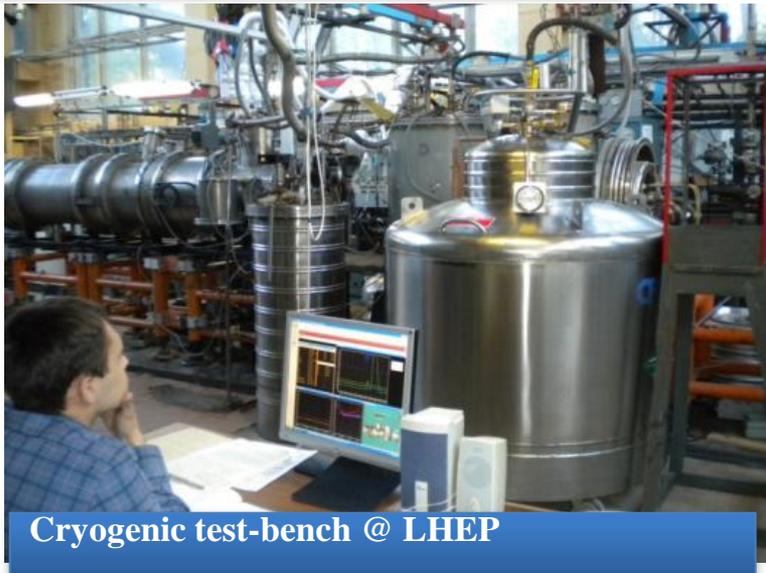

# Magnets for the Booster

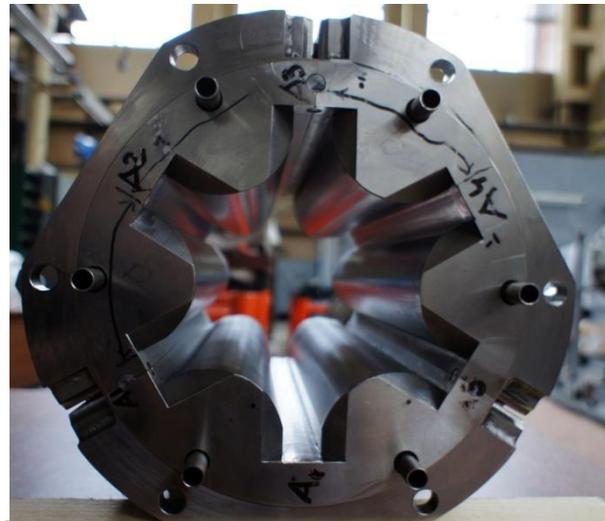

Booster dipole at cryo-test (9690A) and magnetic measurements

Quadrupole lense at assembly for test

Cryogenic test-bench @ LHEP

Sextupole corrector prototype (for SIS100 and NICA booster) at assembly

# NICA: Nuclotron based Ion Collider fAcility

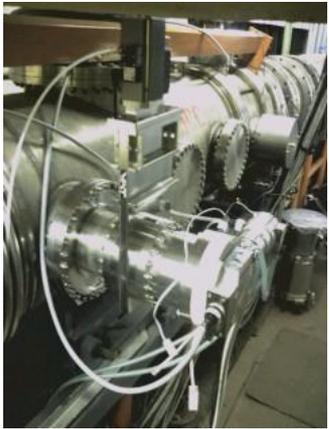

Since 1993, modernized during 2007-2010

**Nuclotron provides now performance of experiments on accelerated proton and ion beams (up to Fe<sup>24+</sup>, A=56, *now Xe<sup>42+</sup>, A=124*) with energies up to 6 AGeV ( $Z/A = 1/2$ )**

under testing just now!**

# New Cryogenic Test-bench @ LHEP

## Test facility for the assembling and testing of superconducting magnets

The test facility is designed for round the clock assembling and cryogenic testing of superconducting magnets of the following types:

- Dipole magnet for the NICA Booster - 40 pcs.
- Quadrupole magnet for the NICA Booster - 48 pcs.
- Dipole magnet for the NICA Collider - 80 pcs.
- Quadrupole magnet for the NICA Collider - 86 pcs.
- Quadrupole magnet for the SIS100 (Project FAIR) - 175 pcs.

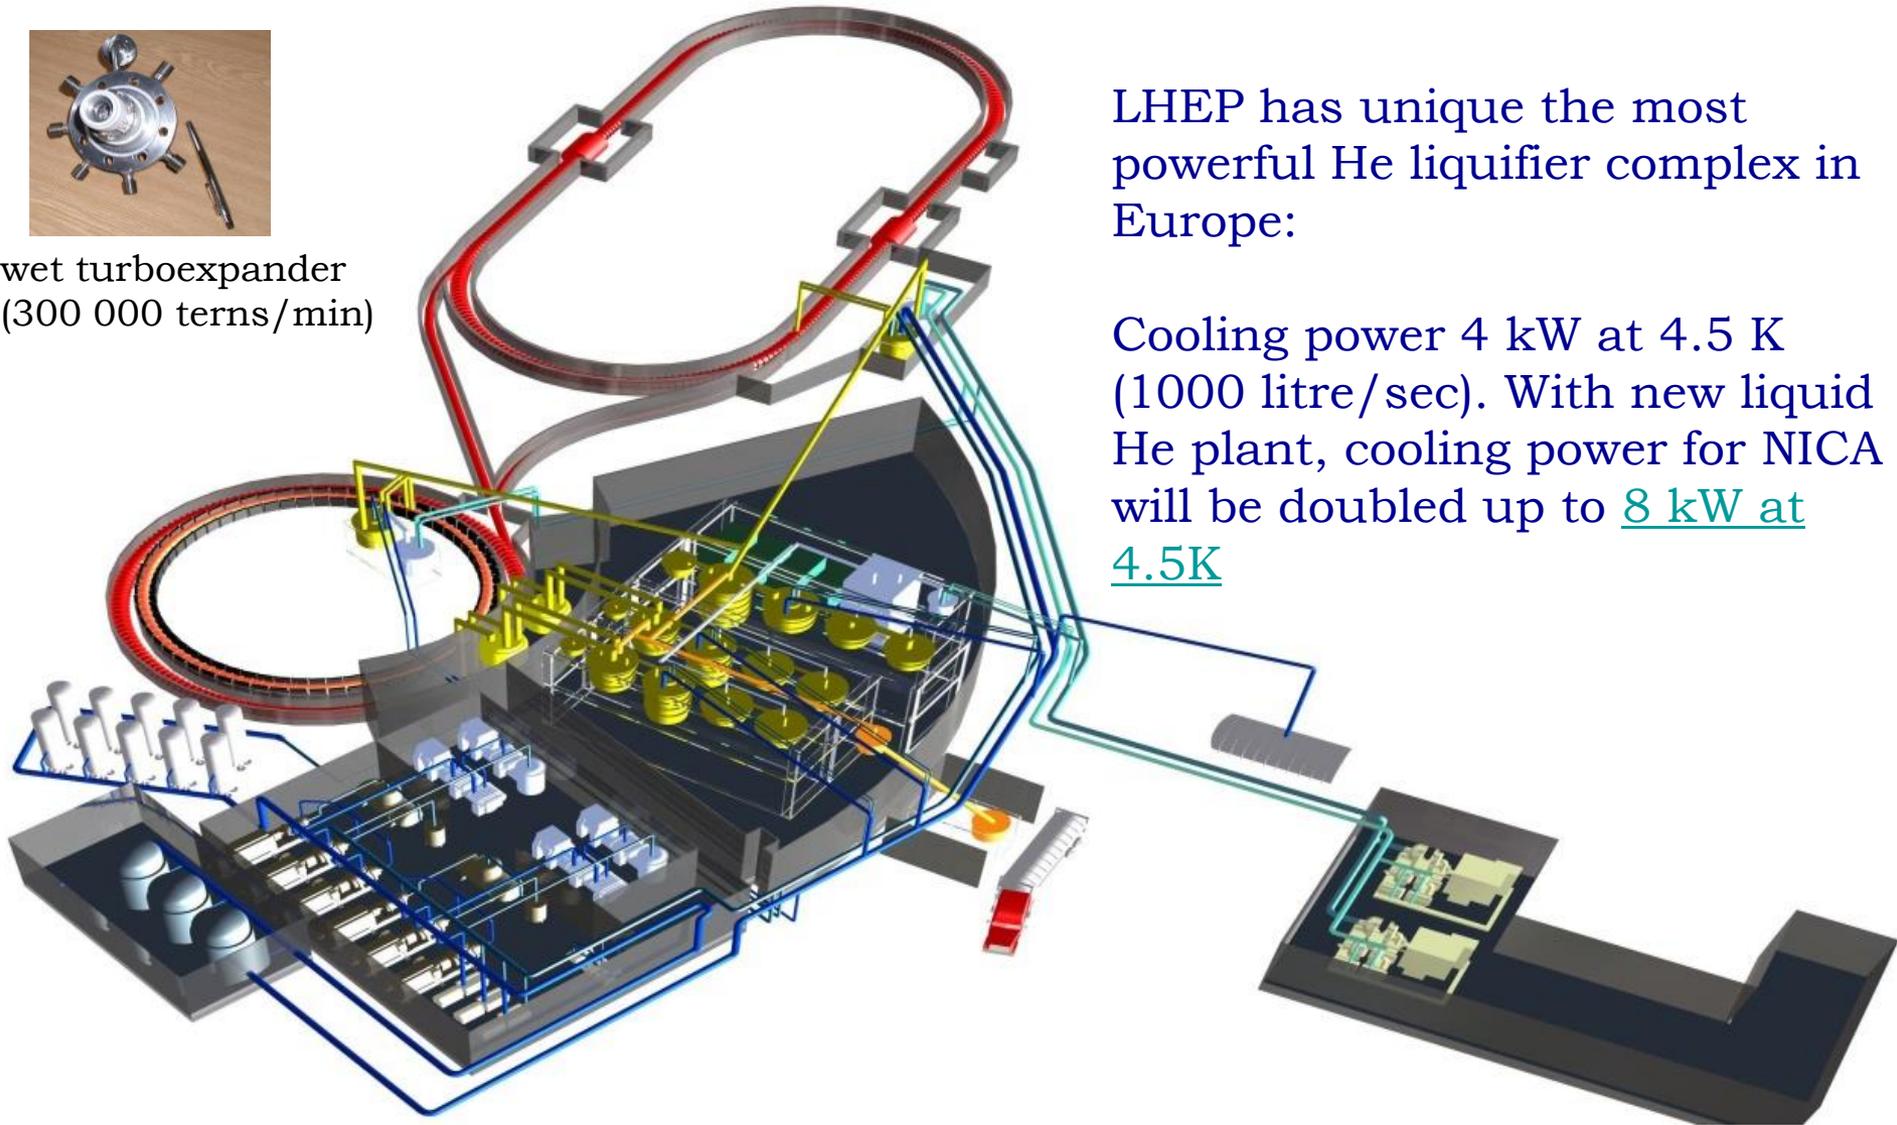

The test facility will allow testing of up to 11 magnets per month, when operating in parallel on 6 benches.

Commissioning of the test facility is scheduled for 2013.

# NICA Cryogenics

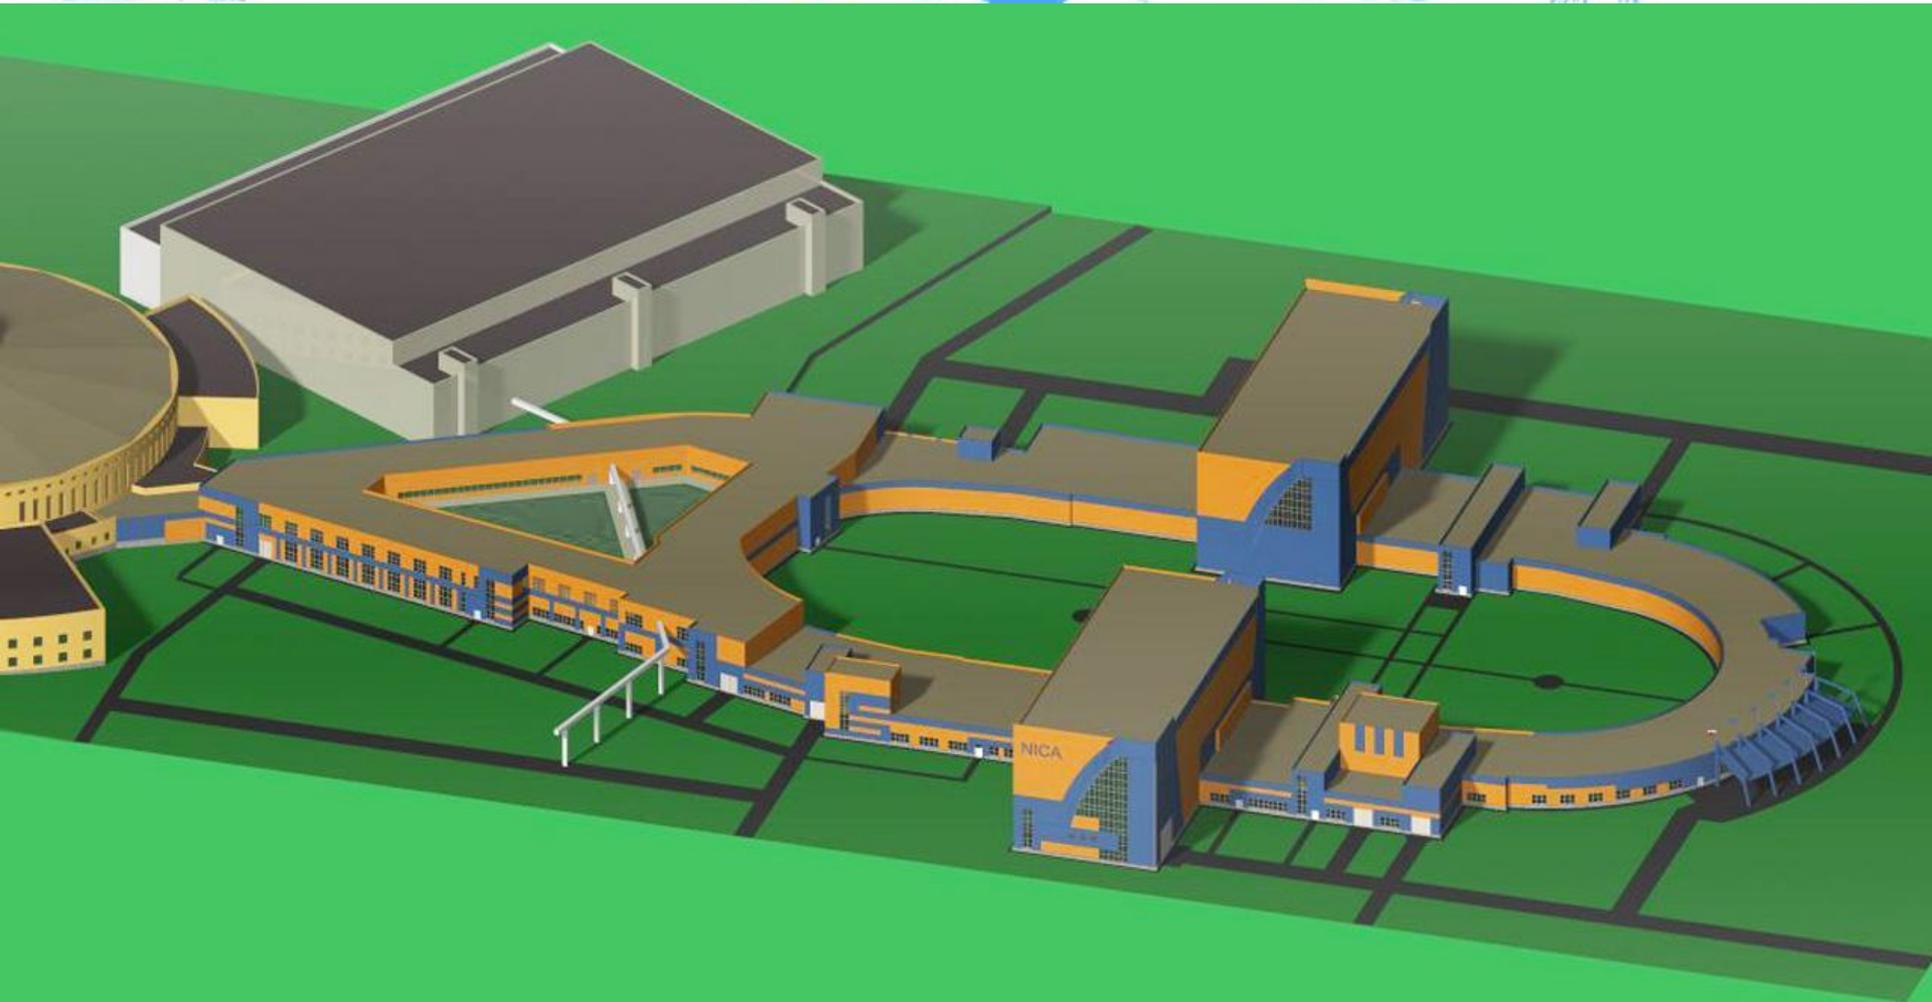

wet turboexpander  
(300 000 turns/min)

LHEP has unique the most powerful He liquifier complex in Europe:

Cooling power 4 kW at 4.5 K (1000 litre/sec). With new liquid He plant, cooling power for NICA will be doubled up to 8 kW at 4.5K

# NICA plan

**ALL geological, geodetical, topography measurements and drillings had been fulfilled and analyzed. Technological part of the TDR (main equipment, engineering systems, etc), radiation and environmental safety, architecture had been fulfilled.**
