MICE: Muon ionization Cooling Experiment

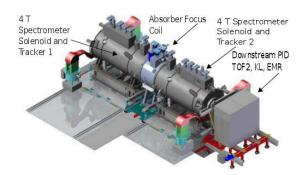

Why use muons?

- ~200× heavier than electrons ⇒ rate of emission of synchrotron/bremsstrahlung radiation lower allowing more compact facilities
- With cooling could be used as high quality beam for Neutrino Factory
- \bullet $\;\mu$ has short lifetime 2.2 $\mu {\rm s}$ only cooling technique which can be employed is ionization cooling

Goals of MICE

- Design, build, commission, and operate section of realistic cooling channel
- Measure its performance in a variety of modes of operation and beam conditions
- Measure material properties of potential absorbers (LiH and liquid hydrogen)

The MICE Experiment: Step IV

Ionization Cooling

The rate of change of normalised emittance due to ionization cooling is:

$$\frac{d\varepsilon_n}{dz} \approx -\frac{\varepsilon_n}{\beta^2 E} \left\langle \frac{dE}{dz} \right\rangle + \frac{\beta_\perp (13.6 \text{MeV})^2}{2\beta^3 Em X_0} \tag{1}$$

Overview of models of multiple Coulomb scattering

 \bullet PDG recommends this formula, based on work by Lynch and Dahl [1, 2] incorporating path length effects (accurate to \sim 11%)

$$\theta_0 = \frac{13.6 \,\text{MeV}}{\rho_\mu c \beta_{\text{rel}}} Z \sqrt{\frac{\Delta z}{X_0}} \left[1 + 0.038 \,\text{ln} \left(\frac{Z^2 \Delta z}{\beta_{\text{rel}}^2 X_0} \right) \right] \tag{2}$$

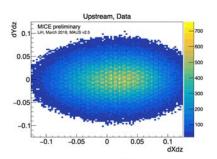

- Resulting distribution is non-Gaussian with the shape dependant on the thickness of the absorber
- Goal of MICE is to measure $d\varepsilon_n/dz$ to precision of 0.1%
- MUSCAT [3] showed poor agreement between GEANT simulations and low Z material scattering data
- MICE has taken scattering data for muons on a LiH target.
 - ► LiH composition: 81% ⁶Li, 4% ⁷Li, 14% ¹H (trace of C, O, and Ca)
 - ► Other absorbers: liquid hydrogen & plastic wedge

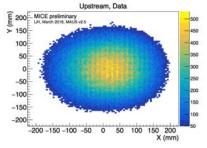

Overview of models of multiple Coulomb scattering

- GEANT4 full Legendre polynomial expansion & uses Urban scattering model [4] for most particles and Wentzel model for muons.
- Moliere [5] calculation solves scattering transport equation describing scattering distribution with single variable χ_a resulting distribution is non-Gaussian
- ELMS, both energy loss and multiple scattering based on electromagnetic first principles—developed by Allison and Holmes
 [6, 7] and shows good agreement with hydrogen data.
- Cobb-Carlisle model [8, 9], samples directly from Wentzel single-scattering cross-section, simulates all collisions with nuclei and electrons – Includes cut-off for the nuclear cross-section and separate contributions for nuclear and atomic electron scattering

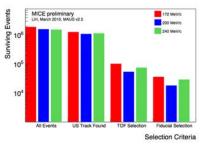

Scattering Data

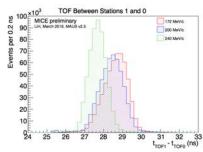

- Field off data sets were collected in ISIS run periods 2015/03 and 2015/04
- A momentum dependent multiple scattering measurement is made
- Measure empty channel scattering
 - ightharpoonup Convolved with physics model of scattering in absorber ightharpoonup prediction.
- Measure absorber scattering
 - A Bayesian deconvolution algorithm unfolds absorber scattering distribution
- χ^2 comparison between data and prediction
 - Width of scattering distribution:
 θ as a function of p

Selection

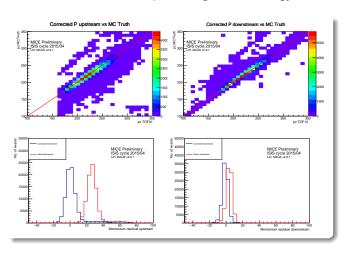

Procedure

- Require an US track. If a DS track not extant, statistics set to overflow values.
- Analysis done in 200 ps TOF bins, as shown in TOF plot
- Require projection of US tracks, including scattering, to appear within central 140 mm radius of DS tracker

Momentum Correction

Correction must be applied to the p as reconstructed by the TOF to account for additional path length and energy loss in channel

- Exact *P* at centre of absorber described by an analytic expression which is second order expansion of the Taylor series in *p/mc*
- Assume constant energy loss

Scattering Data

Define projection angles

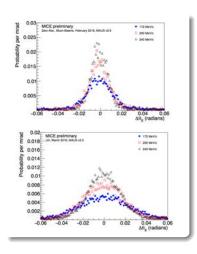

$$\theta_{y} = \operatorname{atan}\left(\frac{p_{DS} \cdot (\hat{y} \times p_{US})}{|\hat{y} \times p_{US}||p_{DS}|}\right) \quad (3)$$

and

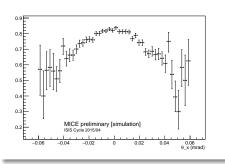

$$\theta_{x} = \operatorname{atan}\left(\frac{p_{DS} \cdot (p_{US} \times (\hat{y} \times p_{US}))}{|p_{US} \times (\hat{y} \times p_{US})||p_{DS}|}\right)$$
(4

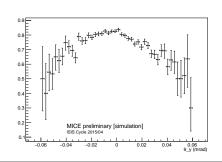

• A simple cross check is that $\theta_x^2 + \theta_y^2 \approx \theta_{scatt}^2$ where θ_{scatt} is defined as:

$$\cos \theta_{scatt} = \frac{p_{US} \cdot p_{DS}}{|p_{US}||p_{DS}|} \tag{5}$$

Tracker Acceptance

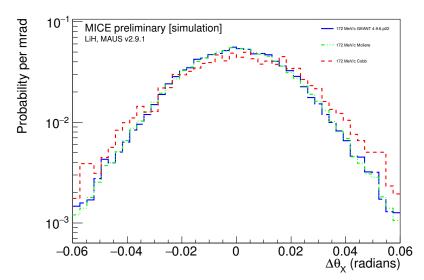

- Pair an US & DS track
- Acceptance is not 100% due to apertures in the channel
- Calculate angle θ as described in slide 9
- Downstream acceptance is defined

No. of tracks in θ bin MC Truth that are reconstructed (6)No. of tracks in θ bin MC Truth

 Correction done on bin-by-bin basis dividing by measured acceptance John Nugent, Daniel Kaplan

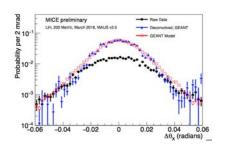

Physics Model & Scattering Prediction

Three different physics models are used, GEANT4, Carlisle-Cobb & Moliere, convolved with the empty channel data

Deconvolution of Raw Scattering Data

- Measure scattering in LiH
- Empty channel data convolved with model
- RooUnfold [10] uses Bayesian conditional probability to deconvolve
- Right: example output from this algorithm

Bayes' Theorem

$$P(C_i|E_j) = \frac{P(E_j|C_i)P_0(C_i)}{\sum_{l=1}^{n_c} P(E_j|C_l)P_0(C_l)}$$

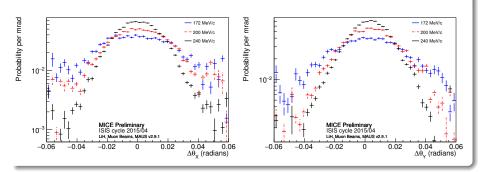

- We want $C_i = \Delta \theta^{abs}$ the deflection angle in the absorber material.
- ullet We measure $E_j = \Delta heta^{tracker}$ the deflection angle measured at the first tracker plane

Systematics

- A study of the systematics is in progress
- The results remain preliminary
- Several sources have been considered
 - Material thickness uncertainties
 - Alignment uncertainties
 - ► TOF uncertainties
 - Fiducial volume uncertainties
 - Pion contamination
 - Definition of scattering angles
 - ► Channel acceptance
- Further work is required to clarify the various contributions

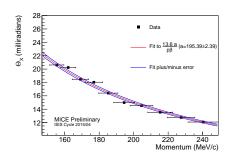

Results slide - deconvolution

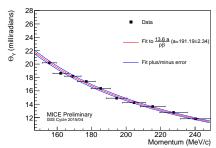

Preliminary MICE result

- ullet Measurement of scattering at each nominal momentum point following the deconvolution procedure fit Gaussian to the central -40 to +40 mrad
- Report the width of the fitted distribution

θ as a Function of Momentum

 Scan across the entire momentum range and measure scattering in both projections in each bin

Conclusions

- MICE has measured multiple Coulomb scattering of μ with 140 < P < 240 MeV/c in lithium hydride
- Data has been compared to popular simulation packages such as GEANT4 and other relevant models such as Moliere and Carlisle-Cobb
- A study of the systematics is in progress, a MICE publication is currently being prepared
- Future work will include a measurement of multiple Coulomb scattering in liquid hydrogen, measurement with magnetic field in the cooling channel and energy loss measurement
