Scanning Magnets

Two rotating gantries + One fixed beam treatment room

Layout of rotating gantry

Scanning Magnets

Two rotating gantries + One fixed beam treatment room

Layout of rotating gantry

Parameter	SMX	SMY
Max. Deflection Angle	55 mrad	65 mrad
Max. Field Strength	0.52 T	0.39 T
Magnet Gap	40 mm	90 mm
Repetition Frequency	100 Hz	40 Hz
Num. of Coil Turn/pole	15	18
Coil Inductance/coil	0.33 mH	0.60 mH
Coil Resistance/coil	2.21 mOhm	2.74 mOhm

Eddy Current Effect

➤ Simulation method (SMX)

ELEKTRA/TR + TEMPO/SS

Eddy Current Effect

- Simulation method (SMX)

ELEKTRA/TR + TEMPO/SS

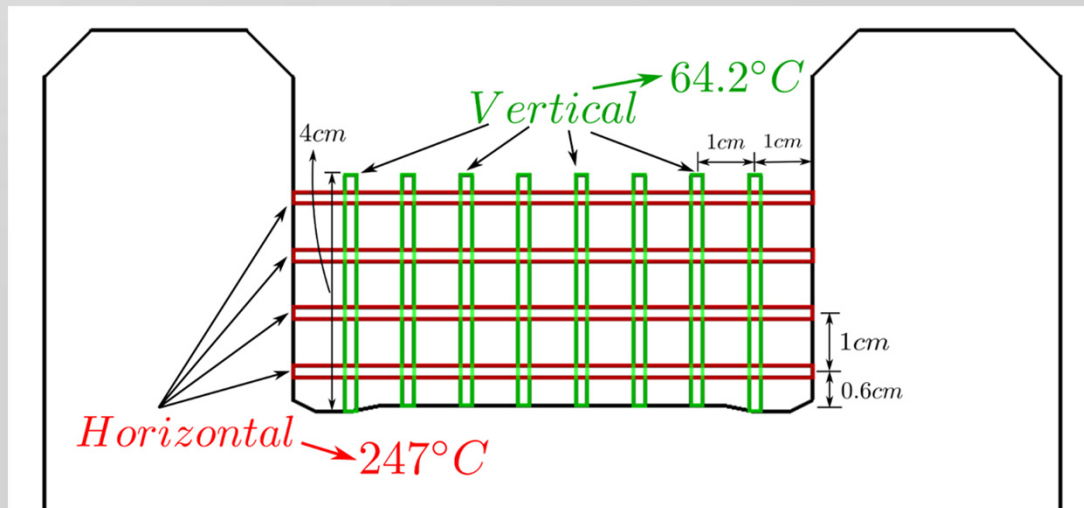

Unoptimized Model

- SLITS

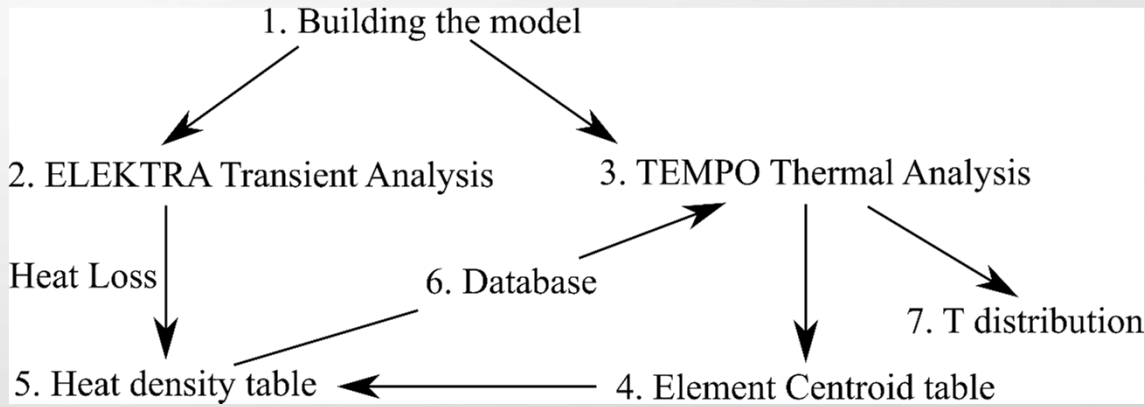

❑ Slits Direction

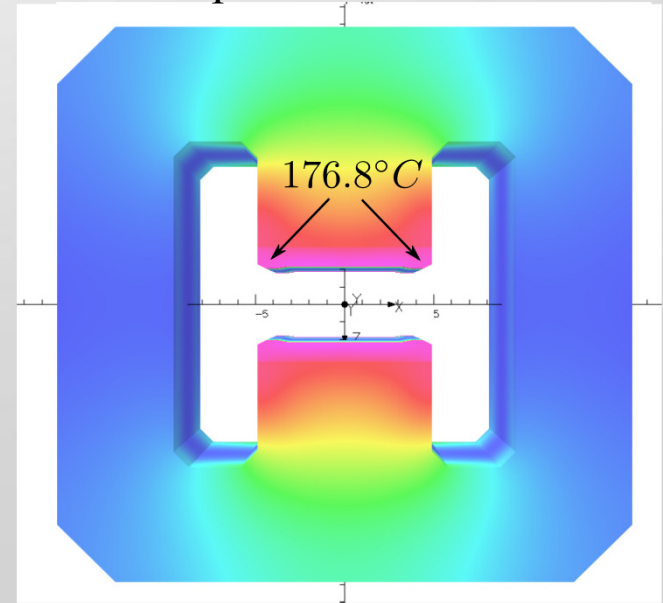

Eddy Current Effect

- Simulation method (SMX)

ELEKTRA/TR + TEMPO/SS

Unoptimized Model

- SLITS

- ❑ Slits Direction
- ❑ Slits Distribution

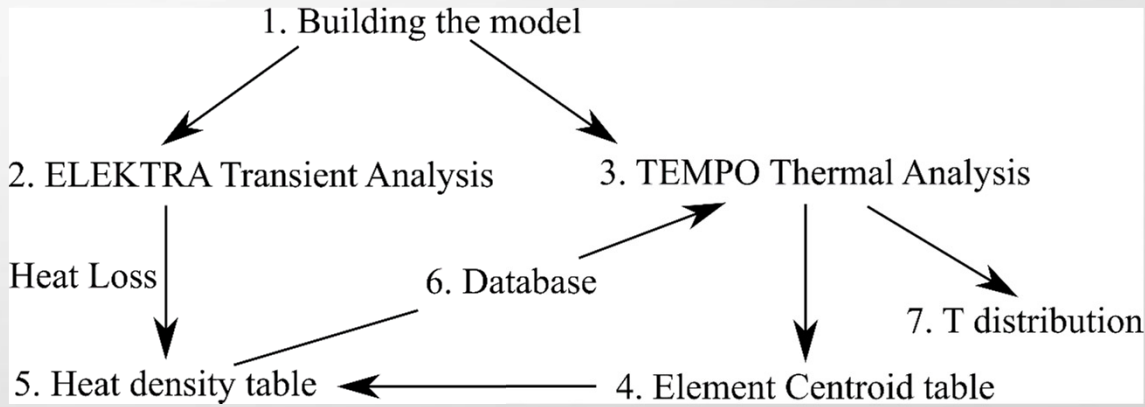

Num_slits	a/mm	b/mm	Max. T/°C
7	15	10	72.29
8	10	10	64.16
9	5	10	73.06

Eddy Current Effect

- Simulation method (SMX)

ELEKTRA/TR + TEMPO/SS

Unoptimized Model

- SLITS

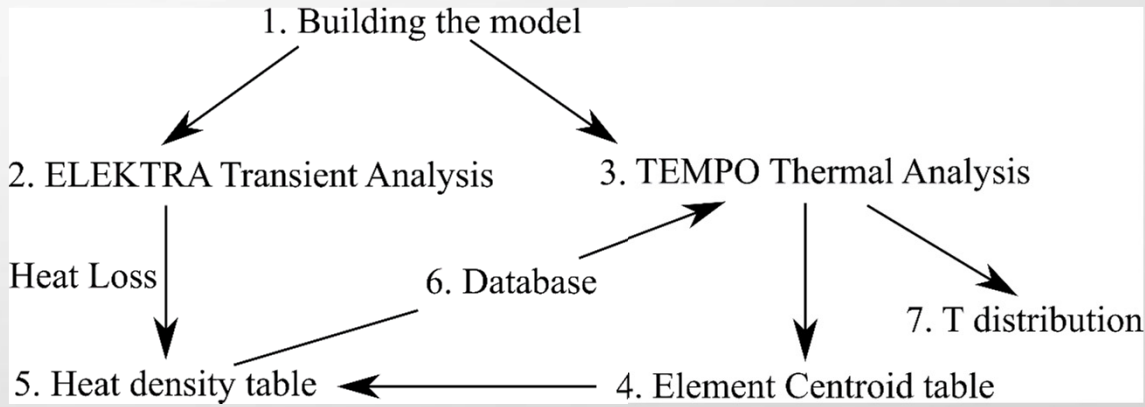

- ❑ Slits Direction
- ❑ Slits Distribution
- ❑ Slit Width

Eddy Current Effect

- Simulation method (SMX)

ELEKTRA/TR + TEMPO/SS

- SLITS

- ❑ Slits Direction **vertical**
- ❑ Slits Distribution **8 slits**
- ❑ Slit Width **2mm wide**

Unoptimized Model

Conclusion

- The length of SAD is optimized to 2.8m.
- The effect of eddy currents in the scanning magnets is large and the temperature rise will destroy the magnets.
- Slits in the edge of the pole are an effective method to reduce the eddy current:
 - Vertical slits can reduce the eddy currents; horizontal slits will concentrate the eddy currents and increase the temperature.
 - The distance between the outermost slit and the edge of the pole is important, wide or tight length is not suitable.
 - The temperature is not sensitive to the slit width.
- The maximum temperature of these two magnets is reduced to 64.2°C and 43.7°C, lowering the allowance temperature rise.
