

# CEPC booster lattice design

Dou Wang (IHEP)

on behalf of CEPC AP group

# CEPC injector chain

- 20 GeV linac provides electron and positron beams for booster.
- Top up injection for collider ring  $\sim 3\%$  current decay
- Booster is in the same tunnel as collider ring, above the collider ring, bypass in IR.
- Budget for transfer efficiency **90%: 95% for booster + 95% for transport lines.**
- Beam current threshold in booster is limited by RF system.
- Feedback systems (Transverse & longitudinal) are need to damp the instability at low energy.

# Requirement update for booster

| Collider ring                                     | Higgs (CDR)  | Higgs (TDR) |
|---|--------------|-------------|
| Number of IPs                                     | 2            | 2           |
| Energy (GeV)                                      | 120          | 120         |

- Horizontal DA requirement of collider ring due to injection

- Booster emittance @120 GeV <1.7nm (3.6nm in CDR)

# Booster TDR optics

D. Wang, C. H. Yu, Y. M. Peng...

- TME like structure (cell length=78m)
- Interleave sextupole scheme
- Emittance@120GeV=1.26nm

- Overall idea: uniform distribution for the Q
- Combined magnet (B+S) scheme possible
- Phase advance/cell: 100° (H) / 28° (V)

# Booster alternative optics

- FODO structure (cell length=70m)
- $90^\circ/90^\circ$  phase advance
- Non-interleave sextupole scheme
- Similar structure as CDR

- Emittance@120GeV=**1.29nm**

# DA results @ 20GeV

- Booster energy: 20GeV~180GeV
- 20GeV:  $BSC_{xy} = (4\sigma_{xy} + 5\text{mm}) * 2$
- Inj. emittance from Linac: 10nm
- Energy spread from Linac: 0.16%

# DA results with errors and correction (w/o multipoles)

D. H. Ji

|                                  | Dipole | Quadrupole | Sextupole |

# DA@20GeV

Dou Wang, Daheng Ji

- Tracking by **SAD** (2500 turns)
- include errors (w. multipole errors)
- Include SR sawtooth orbit (without taper)
- Include SR damping & fluctuation
- On axis injection from Linac to booster
- BSC definition ( $\varepsilon_{inj}=10\text{nm}$ ):  
$$BSC_{x,y} = 2 \times (4 \cdot \sigma_{x,y} + 5\text{mm})$$
- Energy acceptance:  $3 \cdot \delta_{inj} = 0.48\%$

# DA@45GeV

Dou Wang, Daheng Ji

- Tracking by **SAD** (1200 turns)
- include errors (w. multipole errors)
- Include SR sawtooth orbit (without taper)
- Include SR damping & fluctuation
- Off axis injection from booster to collider
- BSC definition ( $\varepsilon_x=0.18\text{nm}$ ,  $\varepsilon_y=\varepsilon_x * 1\%$ ):  
$$BSC_{x,y} = 2 \times (4 \cdot \sigma_{x,y} + 5\text{mm})$$
- Energy acceptance:  $4 * \delta = 0.15\%$

# DA@80GeV

Dou Wang, Daheng Ji

- Tracking by **SAD** (500 turns)
- include errors (w. multipole errors)
- Include SR sawtooth orbit (without taper)
- Include SR damping & fluctuation
- Off axis injection from booster to collider
- BSC definition ( $\varepsilon_x=0.56\text{nm}$ ,  $\varepsilon_y=\varepsilon_x * 1\%$ ):  
$$BSC_{x,y} = 2 \times (5 \cdot \sigma_{x,y} + 3\text{mm})$$
- Energy acceptance:  $4 * \delta = 0.27\%$

# DA@120GeV

Dou Wang, Daheng Ji

- Tracking by **SAD** (250 turns)
- include errors (w. multipole errors)
- Include SR sawtooth orbit (without taper)
- Include SR damping & fluctuation
- On axis injection from booster to collider
- BSC definition ( $\varepsilon_x = 1.26\text{nm}$ ,  $\varepsilon_y = \varepsilon_x * 1\%$ ):  
 $BSC_x = 2 \times (6 \cdot \sigma_x + 3\text{mm})$     $BSC_y = 2 \times (39 \cdot \sigma_y + 3\text{mm})$
- Energy acceptance:  $5 * \delta = 0.5\%$

# DA@180GeV

Dou Wang, Daheng Ji

- Tracking by **SAD** (150 turns)
- include errors (w. multipole errors)
- Include SR sawtooth orbit (**with taper**)
- Include SR damping & fluctuation
- Keep possibility for on axis injection to collider
- BSC definition ( $\varepsilon_x = 2.84\text{nm}$ ,  $\varepsilon_y = \varepsilon_x * 1\%$ ):
  - $BSC_x = 2 \times (6 \cdot \sigma_x + 3\text{mm})$   $BSC_y = 2 \times (50 \cdot \sigma_y + 3\text{mm})$
  - $BSC_{x,y} = 2 \times (5 \cdot \sigma_{x,y} + 3\text{mm})$
- Energy acceptance:  $4 * \delta = 0.59\%$

# Eddy current effect

Dou Wang, Yuemei Peng,  
Daheng Ji

- Dedicated ramping curve to control the maximum K2.

- Analytical estimation for eddy effect\*
- K2 reaches max at 30GeV.

- Al beam pipe (round shape)
  - inner diameter: 55mm, thickness: 2mm
- Dynamic chromaticity is not corrected.
  - Sextupole field is attached to dipole
- DA tracking including eddy effect and error effects
- Independent sext. (~100) — chromaticity adjustment

\*Yuan Chen et al., Analytical expression development for eddy field and the beam dynamics effect on the CEPC booster, IJMPA, Vol. 36, No. 22 (2021) 2142010

# On-axis injection at Higgs energy

- Swap-out injection
- Current threshold in booster: 1A
- Current decay for collider: 3% (top up mode)
- 4 damping times to merge the bunches in booster

# On-axis injection at Higgs energy (50MW upgrade)

- Swap-out injection
- Current threshold in booster: 1.4 A
- Current decay for collider: 3% (top up mode)
- Small upgrade for the RF power source

# Beam beam instability for on-axis injection

Yuan Zhang

- ❖ Collision stability check for on-axis injection scheme at 120GeV

○ e- ( $N_e = 14 \times 10^{10}$ )

○ e+ ( $N_e = 14 \times 10^{10}$ )

- Emittance X = 1.26nm
- Energy spread = 0.1%
- Bunch length=1.85mm
- Coupling=1.0%

- Emittance X = 0.64nm
- Energy spread = 0.1%
- Bunch length=2.25mm
- Coupling=0.2%

# Dipole reproducibility requirement@20GeV

- Increase/decrease the strength of all the dipoles by the same amount.
- Evaluate the influence: working point, closed orbit, DA, energy acceptance
- Working point should not pass through the lower order resonance
- Small shrink for dynamic aperture
- Reproducibility requirement for dipoles: ~0.04%
- Stability requirement for power supply: ~0.01%
- Dipole field error tolerance slightly loser than 10GeV.

# Effect of earthfield @20GeV

D. H. Ji, D. Wang

- ~20% vacuum pipe (drift) is exposed in earthfield directly.
- treat drifts as week dipole to simulate the effect of earthfield
- Assume earthfield: **0.6 gauss** (simple model: perpendicular component only )
- Working point can be corrected by weaken the dipoles systematically (-0.07%)
- Earthfield problem can be solved by global orbit correction.

# Booster ramping scheme

Dou Wang, Xiaohao Cui

# Beam parameter evolution

- Injection emittance: 10nm @20GeV
- Beam parameters reach balance after 60GeV.

# RF ramping curve

- Different RF ramping curve for each energy mode (constant  $\nu_s$ )
  - $\nu_s$  for  $t\bar{t}$ : 0.14
  - $\nu_s$  for Higgs: 0.094
  - $\nu_s$  for W & Z: 0.088
- Max RF voltage @ $t\bar{t}$  determined by longitudinal quantum lifetime & DA.
  - $\eta_{RF} \sim 12 \times \delta$
  - VRF (180GeV)=9.8GV

# Longitudinal acceptance

- $\pm 3$  times of sigma for the longitudinal beam size

# Optics parameter comparison

D. H. Ji, W. Kang

➤ Magnets' cost of TME is lower than FODO 1

- Less independent sextupole for TME
- Quadrupole strength of TME is lower

➤ TME is less sensitive to error effects

- Weaker quad/sex strength

➤ TME has lower magnets' power consumption

# Booster power consumption @Higgs

- The technical systems with changes are considered.
- The power consumption of TDR is lower than CDR with much lower emittance.

| Technical system     | CDR [MW] |         | TDR [MW] |         | Budget increment [MW] |         |

\*Diameter of beam pipe is 55mm for re-injection with high single bunch current @120GeV.

# Summary

- Booster energy range is enlarged in TDR. ( $10\text{GeV}/120\text{GeV} \rightarrow 20\text{GeV}/180\text{GeV}$ )
- Update booster design with smaller emittance in TDR— support for CEPC high lum. scheme
  - TME structure with combined magnets (B+S)
  - DA with error effects fulfill the requirements
  - Booster parameters update — consistent with CEPC TDR parameters at 4 energy
- 30GeV injection is under consideration for the cost saving.
  - The non-oriented silicon laminations for the iron dominated dipole magnet can be used at 30GeV.
