See also N.Biancacci, IPAC18, WEYGBE4

# LHC Beam stability in 2017

- Lower stability margins than predicted from impedance model
  - **x2 higher octupole current needed**

See also **N.Biancacci, IPAC18, WEYGBE4**

# LHC Beam stability in 2017

- Lower stability margins than predicted from impedance model
  - **x2 higher octupole current needed**

See also N.Biancacci, IPAC18, WEYGBE4

- More critical situation at lower chromaticities
- Different destabilizing mechanisms under investigation
  - Damper noise, coupling, optics errors, long range beam-beam, tail distributions...

# The High Luminosity-LHC project

- More than a factor 2 peak luminosity compared to LHC

	LHC	HL-LHC nominal	HL-LHC ultimate
$L_{\text{peak}} / 10^{34} \text{ cm}^{-2}\text{s}^{-1}$	2	5	7.5
$L_{\text{int}} / \text{fb}^{-1}/\text{y}$	50	262	325

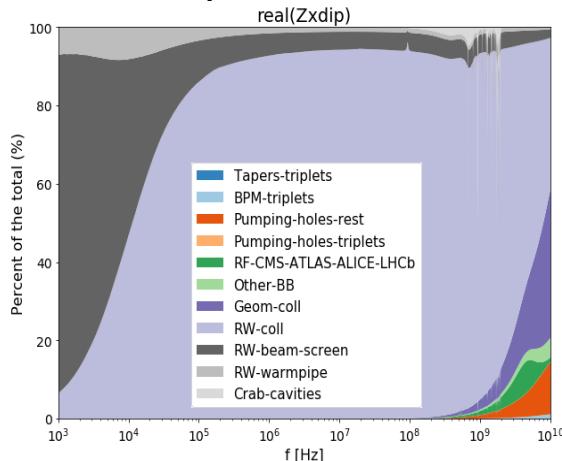

- Increased bunch intensity, decreased beam emittance

	LHC	HL-LHC standard	HL-LHC BCMS
Energy / TeV	6.5	7	7
# of bunches	2544	2760	2748
$N_b / 10^{11} \text{ p.p.b}$	1.2	2.3	2.3
$\varepsilon_{x,y}^{\text{rms}} / \mu\text{m}$	2.5	2.1	1.7
$\sigma_z^{\text{rms}} / \text{cm}$	9	9	9

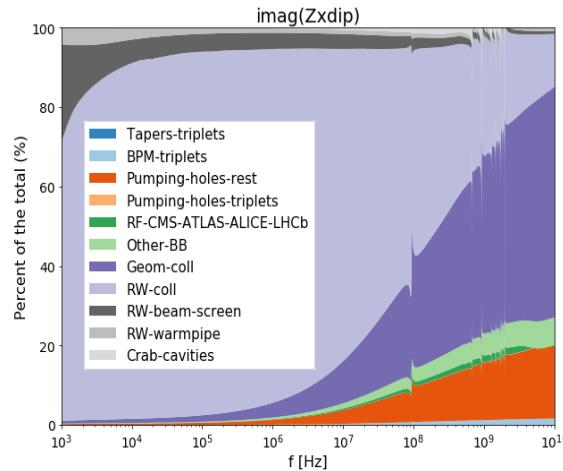

- Brighter beams will be a challenge for beam stability
  - Need to keep a factor 2 margin in HL-LHC

## Stability in the HL-LHC era

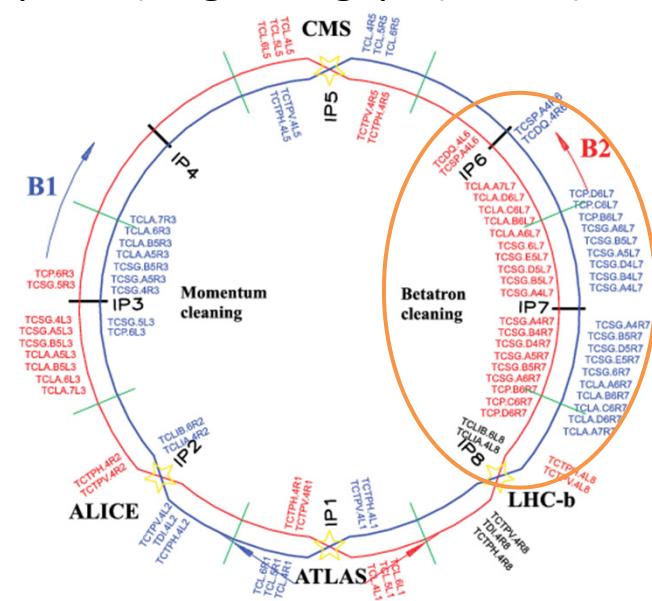

- At top energy, the **collimators** are the main contributors to the impedance
    - 54 per beam, 11 in IR7 betatron cleaning region
    - In IR7: made of resistive materials (Carbon Fiber Composite), tightest gaps (<2mm)
  - **Low resistivity collimators** will be implemented in HL-LHC

# HL-LHC impedance budget at top energy

# LHC collimation system

# TMCI threshold in LHC / HL-LHC

# TMCI threshold in LHC / HL-LHC

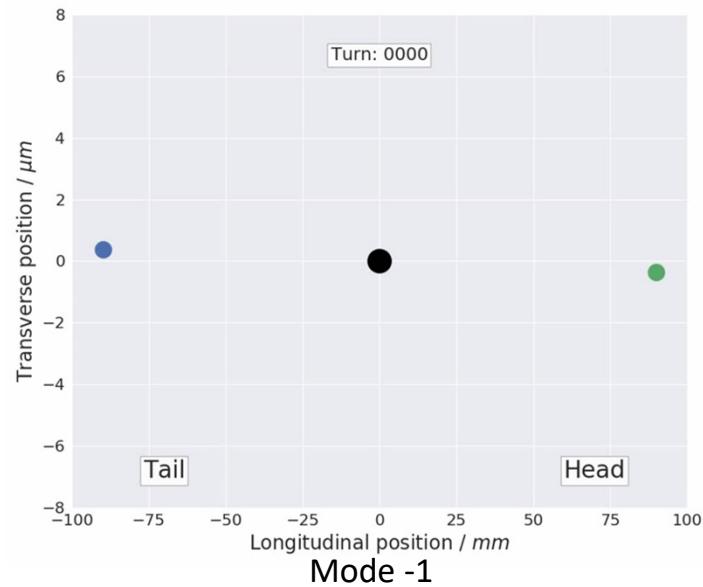

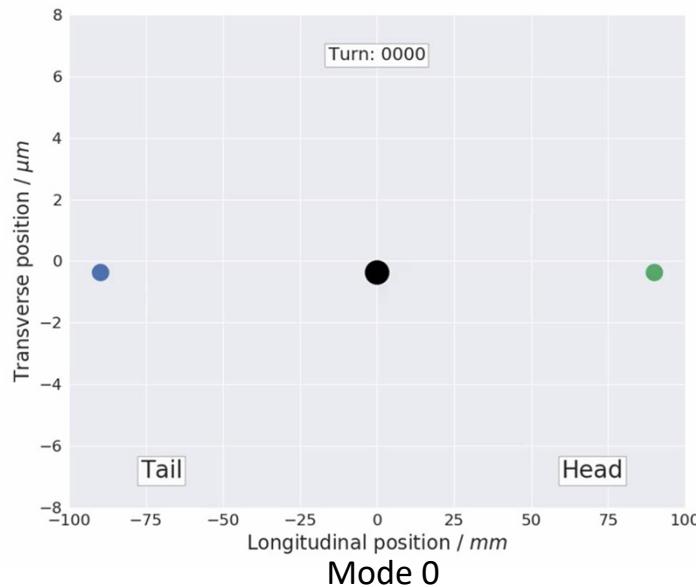

- Need to know the **single bunch stability limits**
  - Transverse Mode Coupling Instability could be a single bunch intensity limitation
  - It could help understand the tighter stability margins at low chromaticities
  - HL-LHC situation could be more critical because of higher brightness beams
- Measurement of the **tune-shift as a function of intensity** to assess it
  - Simulations using the LHC and HL-LHC impedance models
  - Measurement in the machine: need to work with LHC operational constraints
- Can help understand the discrepancies between predictions and measurements
- Showcase the **benefice of the impedance reduction for HL-LHC**

- Use a slightly positive chromaticity
  - Ensure stability of mode 0
- No clear mode coupling between modes 0 and -1 anymore
- But tune-shift vs intensity slope is preserved

# LHC tune shift vs intensity

Tune-shift vs. intensity, Beam 1, horizontal plane

Transverse mode coupling instability in LHC

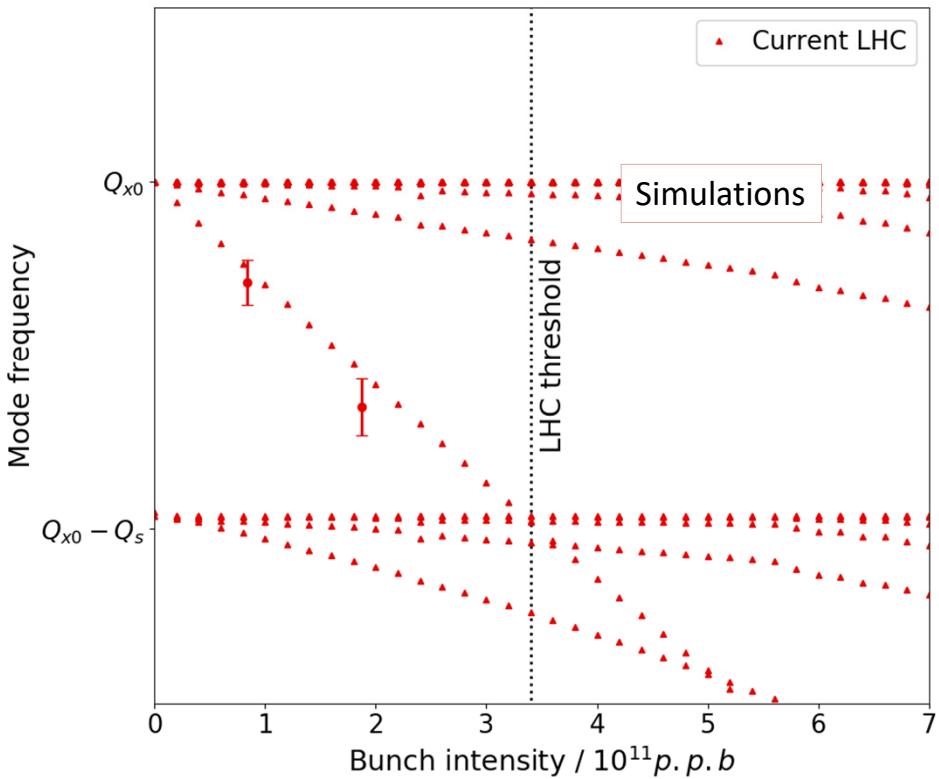

- Measurement with **2 or 3 bunches per beam**
  - Number limited by **machine protection constraints**
- Bunch-by-bunch tune measurement
  - **High precision measurement with the transverse damper stripline pickup** (tune resolution:  $10^{-5}$ )
- Tentative to observe mode coupling by closing further the collimators

# LHC tune shift vs intensity

Tune-shift vs. intensity, Beam 1, horizontal plane

Transverse mode coupling instability in LHC

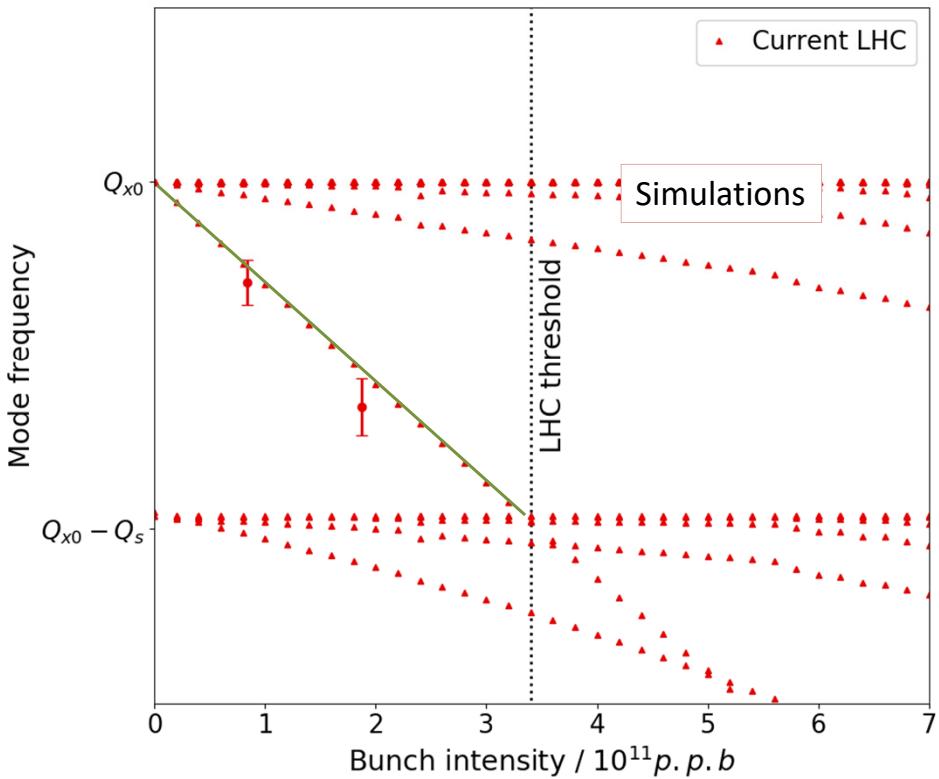

- Measurement with **2 or 3 bunches per beam**

  - TMCI in the LHC era
  - TMCI in the HL-LHC era
- Conclusion and perspectives

# Conclusions

# Conclusions

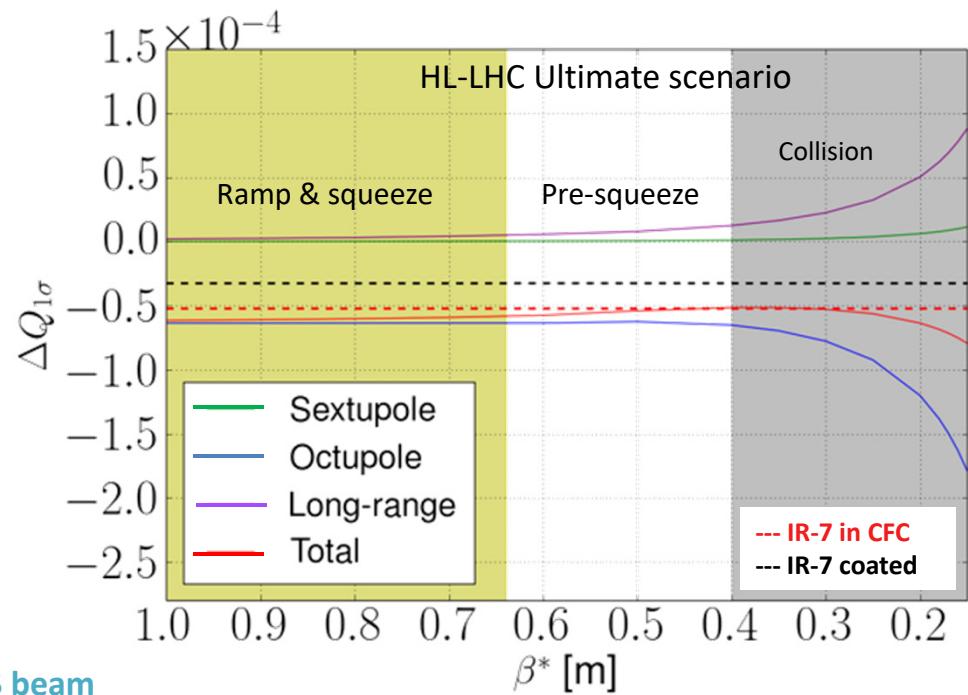

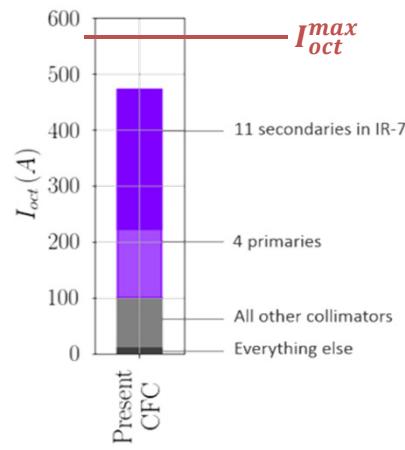

- The LHC TMCI threshold was investigated with simulations and measurements
  - Measurement useful to assess the LHC impedance and stability model at low chromaticities
- Direct measurement in the machine is challenging because of operational and safety constraints
  - The TMCI threshold can be inferred by measuring the tune-shift versus bunch intensity
  - Simulations were performed to find a good parameters set for the measurement
- Highlighted the beneficial effect of low resistivity collimators for HL-LHC
  - Reproduced an equivalent HL-LHC impedance by changing the collimators gaps
  - Clear tune-shift reduction and inferred a TMCI threshold two times higher than for LHC
- Other effects that can act on the mode coupling are being investigated
  - Effect of the transverse damper
  - Landau damping in the mode coupling regime

*Thank you for your attention*

# The HL-LHC stability model

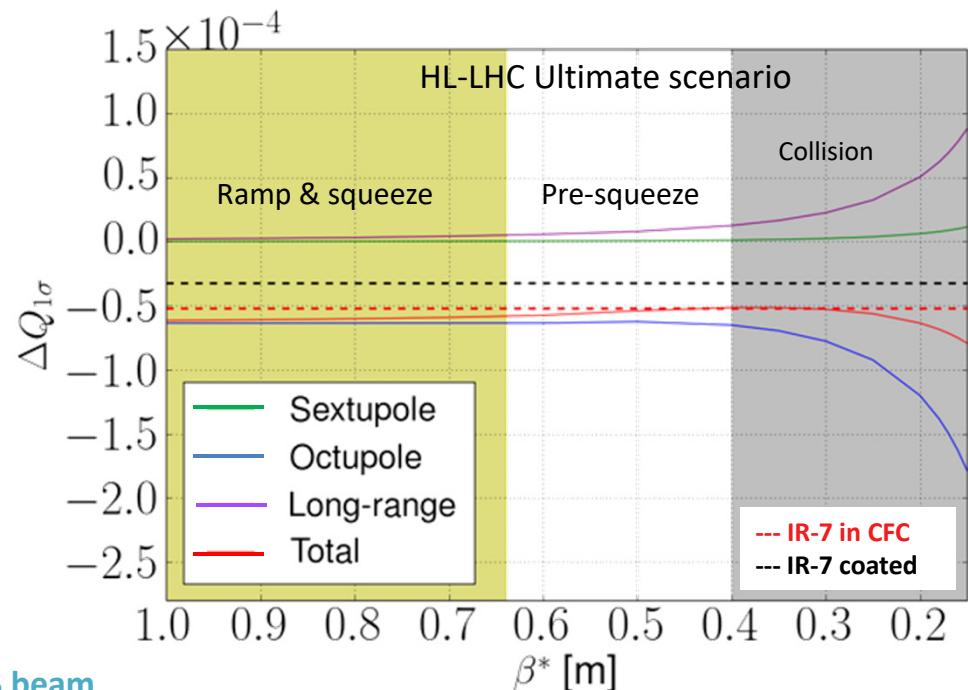

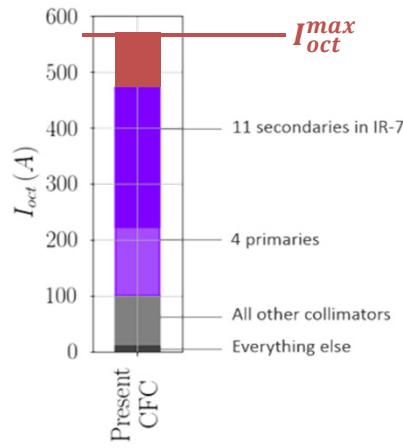

N.Biancacci, IPAC18, WEYGBE4

- HL-LHC with LHC collimators: tight margins for BCMS beam
- Impedance: 480 A out of 570 A for Ultimate scenario at  $\beta^* = 41cm$ .
- Considering long ranges effect: no margin for Ultimate scenario

# The HL-LHC stability model

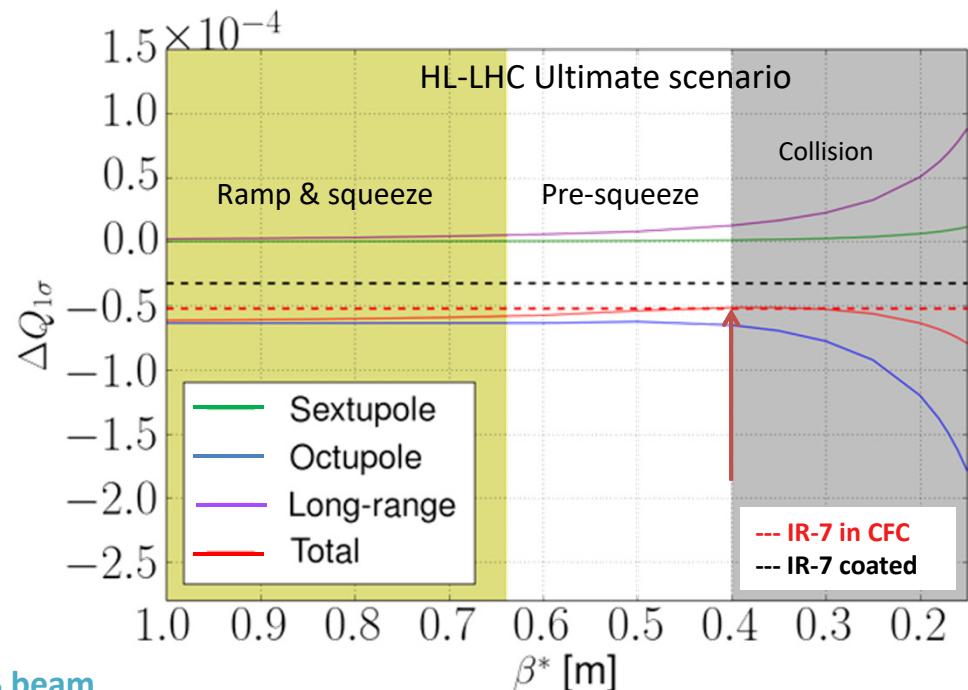

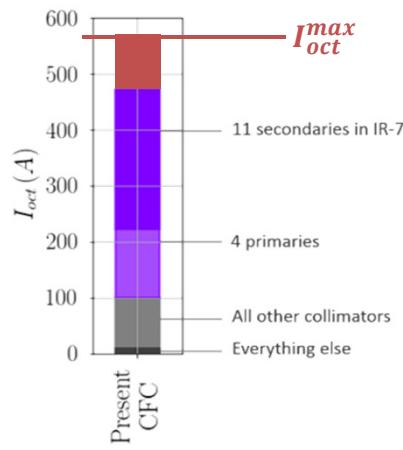

N.Biancacci, IPAC18, WEYGBE4

- HL-LHC with LHC collimators: tight margins for BCMS beam
- Impedance: 480 A out of 570 A for Ultimate scenario at  $\beta^* = 41cm$ .
- Considering long ranges effect: no margin for Ultimate scenario

# The HL-LHC stability model

*N.Biancacci, IPAC18, WEYGBE4*

- HL-LHC with LHC collimators: tight margins for BCMS beam
- Impedance: 480 A out of 570 A for Ultimate scenario at  $\beta^* = 41\text{cm}$ .
- Considering long ranges effect: no margin for Ultimate scenario

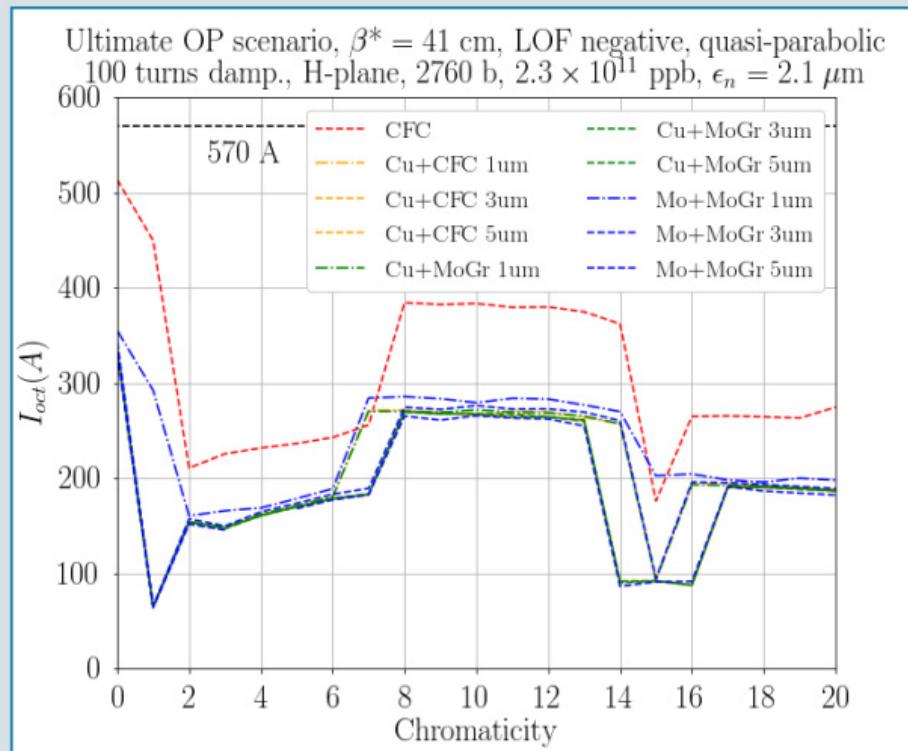

# Octupole threshold increases for thinner coatings

Mo: +20 A for Q' ~ 8-12

Cu: no significant difference for Cu around Q' ~ 10

The effect may be large at some chromaticities

**S. Antipov**

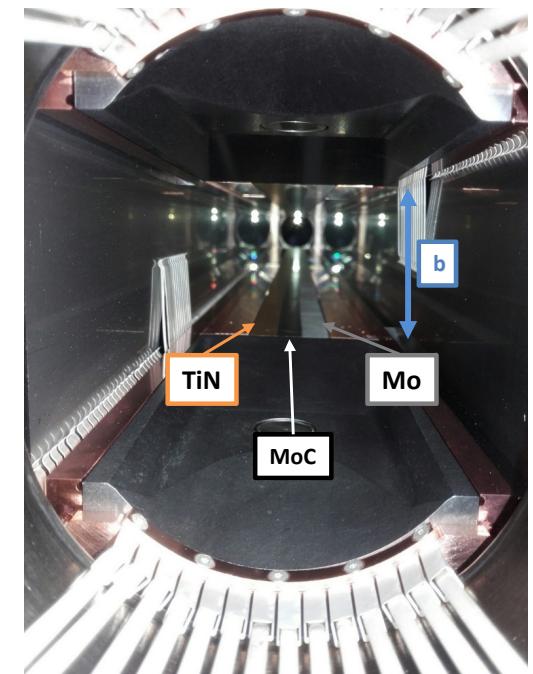

# TMCI in the LHC: measurement procedure

- Measurement goals
  - Infer the TMCI threshold by measuring the tune-shift vs intensity
  - Try to observe a mode coupling instability in the LHC
- 8h time slot on Sep. 15<sup>th</sup> to 16<sup>th</sup> 2017 night to perform the measurement
- Machine safety: each beam can not contain more than  $3 \cdot 10^{11} p.p.b$
- Measurement procedure:
  1. Inject 2/3 bunches of different intensities, and ramp to top energy
  2. Bunch-by-bunch tune measurement: high precision tune measurement with the transverse damper stripline pickup (tune resolution:  $10^{-5}$ )
  3. Close the collimators to increase the machine impedance and repeat the measurement
- Tentative to observe mode coupling by closing further the collimators

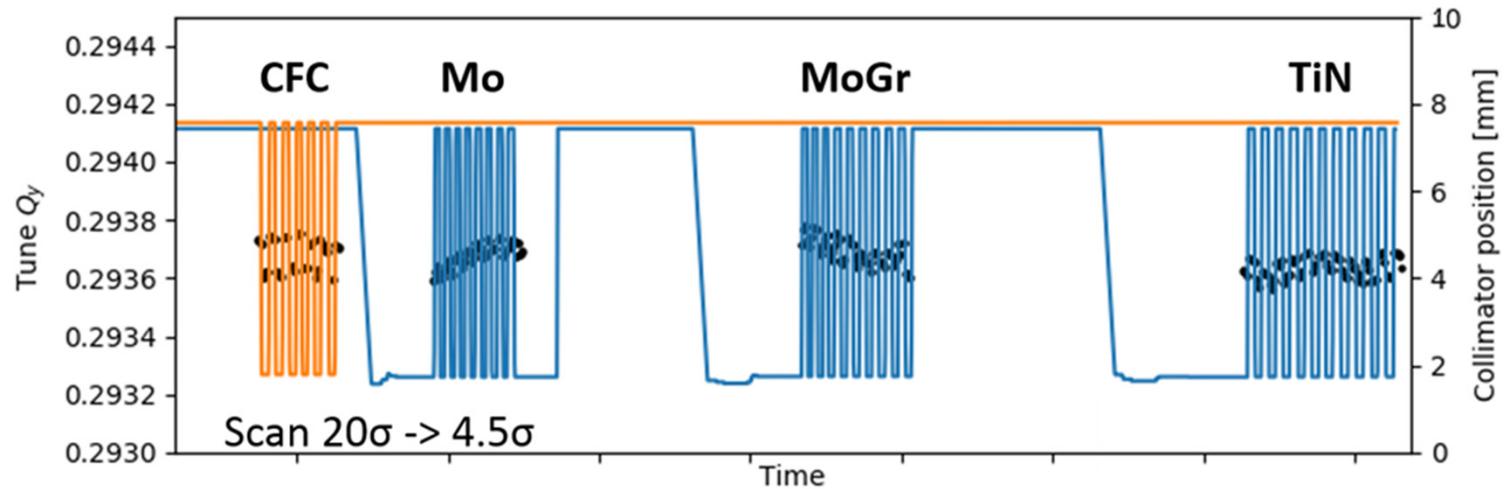

# TCSPM: low resistivity collimator prototype

- Collimator impedance scales as  $\sqrt{\rho}/b^3$ 
  - $\rho$ : resistivity in  $\Omega \cdot m$
  - $b$ : gap in  $m$
- To reduce the impedance
  - Decrease the resistivity
  - Increase the gaps
- A prototype collimator was installed in the LHC to test three different materials

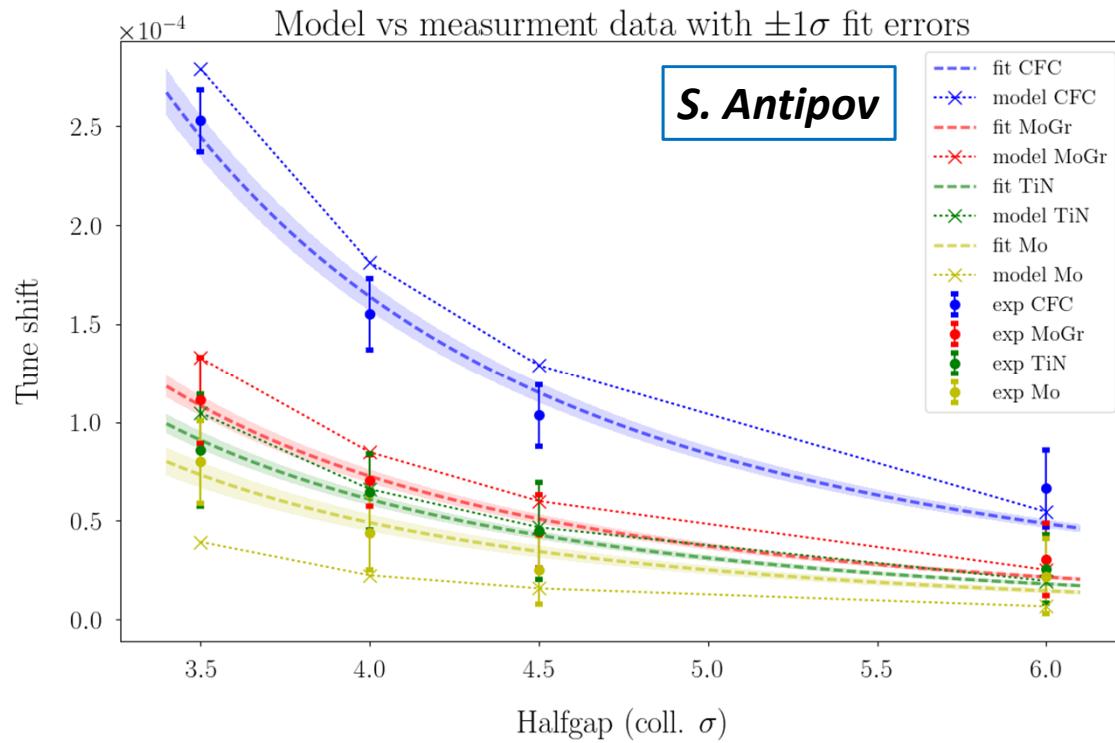

# TCSPM: tune shifts measurement

- On-line analysis of the tune-shifts for the three materials
- State of the art transverse damper control allowed to measure shifts of the order of  $10^{-5}$

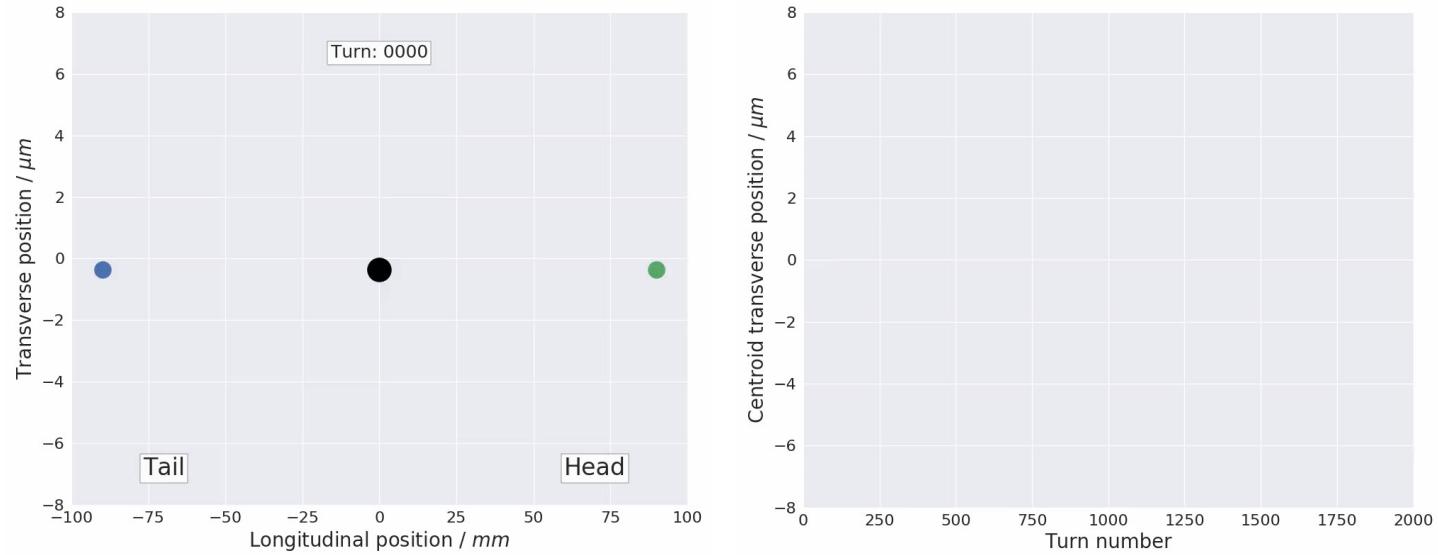

# TCSPM: tune shifts measurement

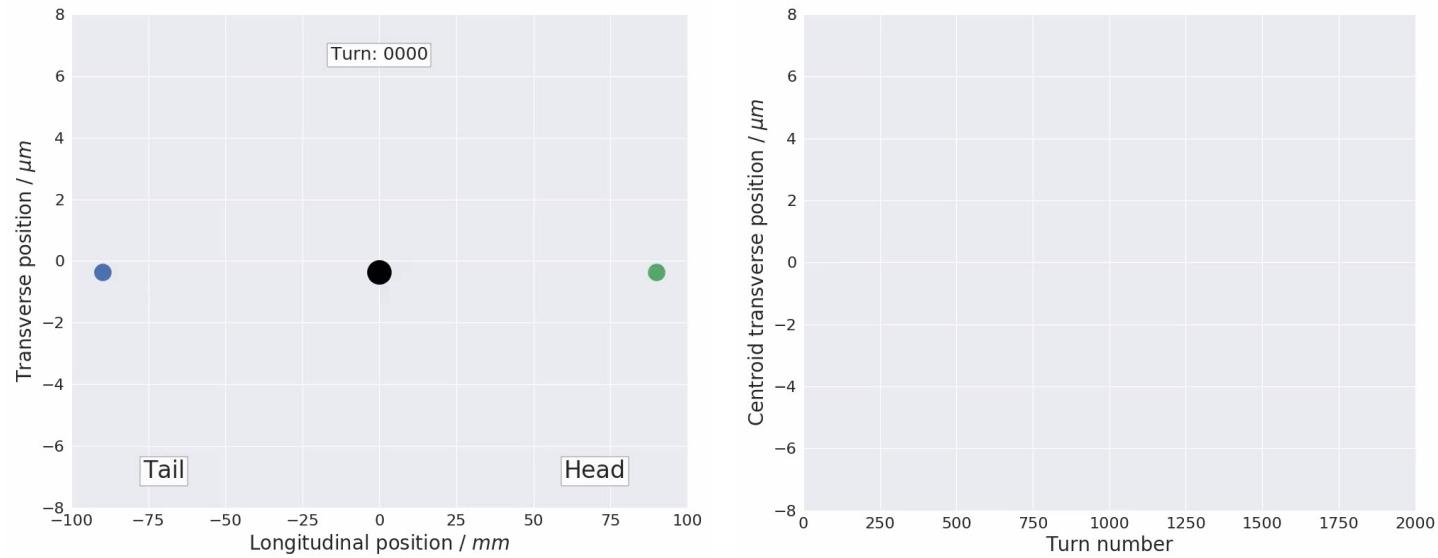

- The post-processing highlighted discrepancies with the impedance model used

# Beam dynamics without collective effects

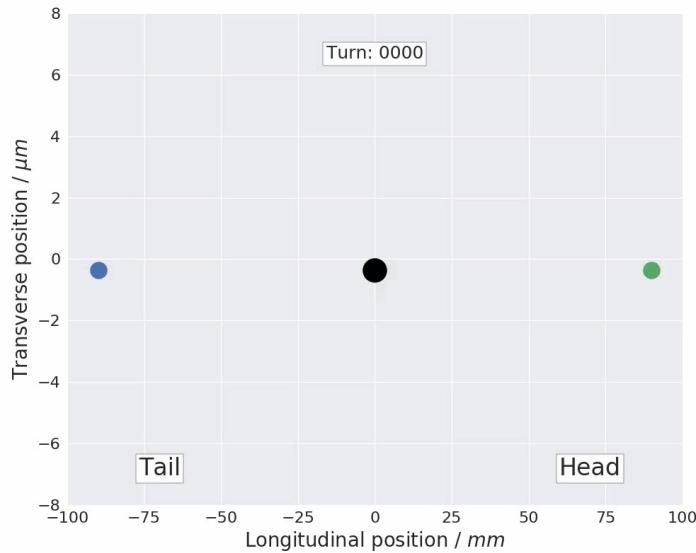

# Beam dynamics with impedance effects

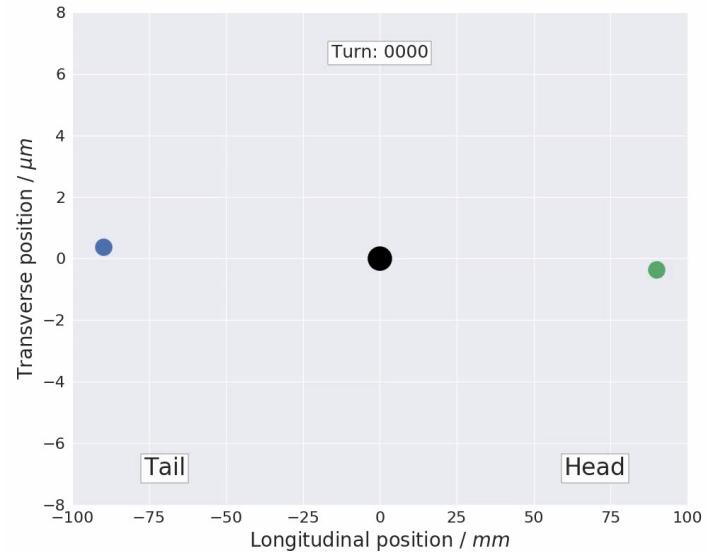

# Transverse mode coupling instability

- For low bunch intensity, the oscillation modes are independent

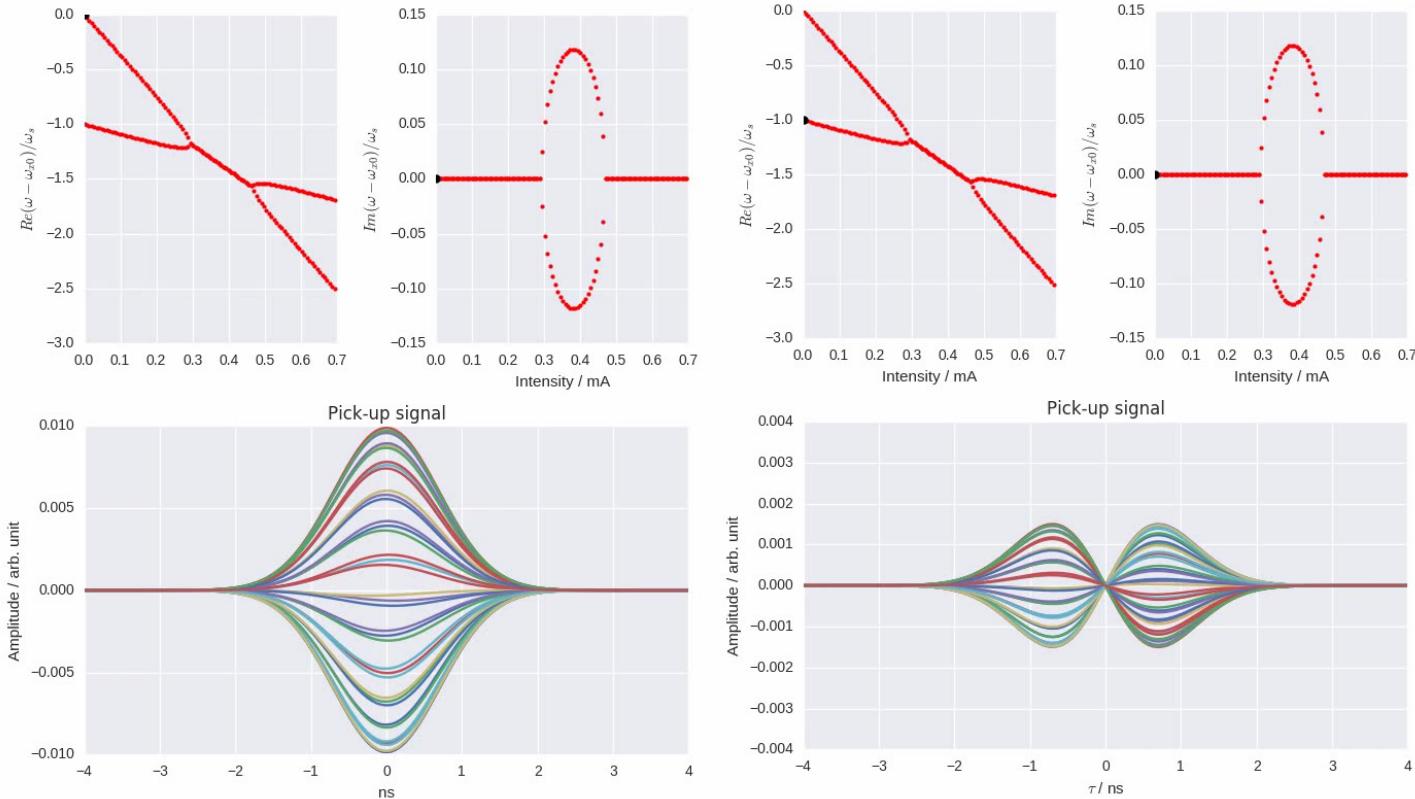

Mode 0

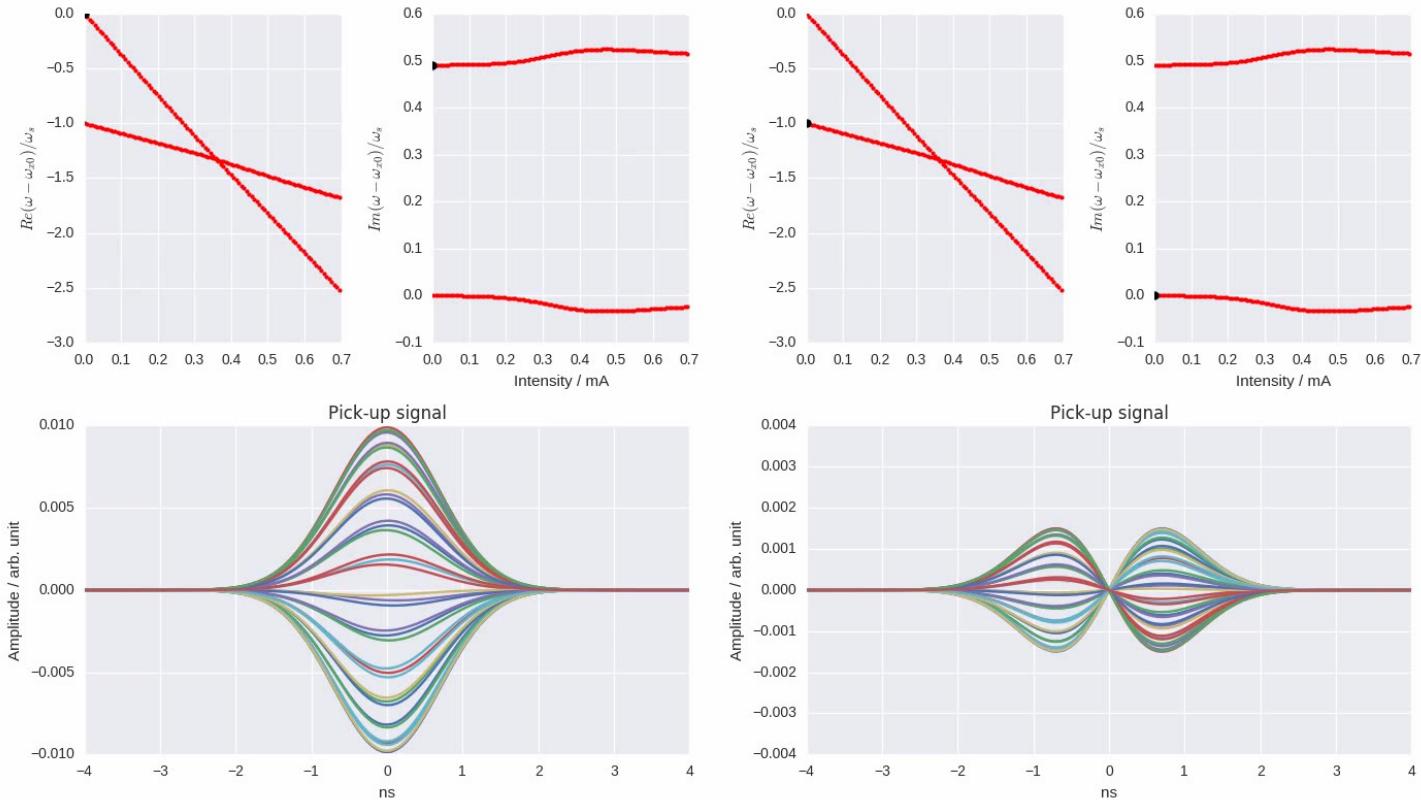

Mode -1

# Effect of the transverse damper

**SPS Q26, Resonator impedance**  
 **$Q'=0, f_r \tau_b = 2.8$**   
**No damper**

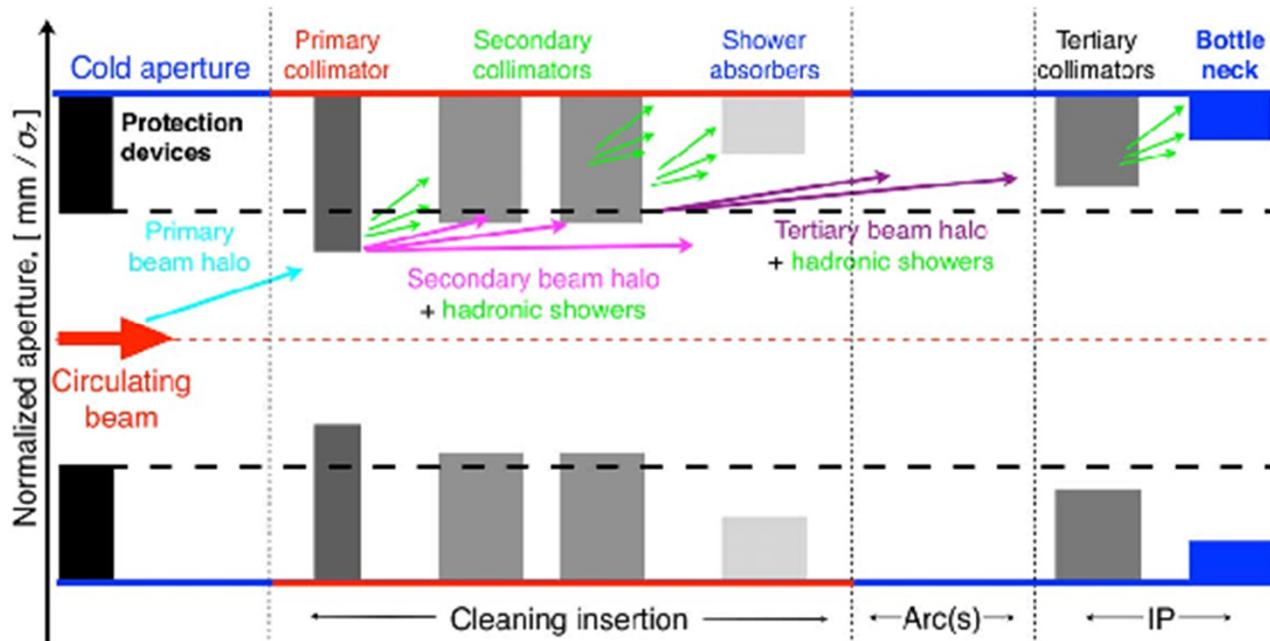

**SPS Q26, Resonator impedance**  
 $Q'=0, f_r \tau_b = 2.8$   
**100 turns damper, resistive**

# LHC Collimation system

# LHC collimation system principle

- A superconducting magnet can quench if  $\sim 10^9$  particles hit it
- The collimators are here to intercept stray protons
- Because of their high energy, the intercepted protons create particle showers that need to be intercepted as well

# LHC collimation system layout
