## Outline

- Introduction
- Problem Overview - Fundamental Limitations
- New Approach based on Movable BPMs
- Preliminary Tests
- Differential Measurements
- Conclusion

## Introduction

What is a Quadrupolar Pick-Up (PU)?

- an electromagnetic Pick-Up, e.g. a BPM
- measures the $2^{\text {nd }}$ order term (quadrupolar moment) of the electrode signals.

$$
\begin{aligned}
U_{h 1} & \propto \frac{a}{2 \pi}+\frac{1}{\rho} \frac{2 \sin (a / 2)}{\pi} x \\
& +\frac{1}{\rho^{2}} \frac{\sin (a)}{\pi} \frac{\left(\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}\right)}{\text { Quadrupolar Term }}+\cdots
\end{aligned}
$$

## Introduction

What is a Quadrupolar Pick-Up (PU)?

- an electromagnetic Pick-Up, e.g. a BPM
- measures the $2^{\text {nd }}$ order term (quadrupolar moment) of the electrode signals.

$$
\begin{aligned}
U_{h 1} & \propto \frac{a}{2 \pi}+\frac{1}{\rho} \frac{2 \sin (a / 2)}{\pi} x \\
& +\frac{1}{\rho^{2}} \frac{\sin (a)}{\pi} \frac{\left(\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}\right)}{\text { Quadrupolar Term }}+\cdots
\end{aligned}
$$

## Motivation

Support Beam Size / Emittance measurements
> Non-intercepting
> Existing PU technology (BPMs)
$>$ Energy independent

## Wire Scanners (WS)

- Partially distractive
- Limited by Intensity

Synchrotron Light Monitors (BSRT)

- Limitations during energy ramp
- Need WS for calibration

## Standard Measurement Technique

PU signals as a multipole expansion

$$
\begin{aligned}
& U_{h 1}=i_{b}\left[c_{0}+c_{1} D_{x}+c_{2} \boldsymbol{Q}+\cdots\right] \\
& U_{h 2}=i_{b}\left[c_{0}-c_{1} D_{x}+c_{2} \boldsymbol{Q}+\cdots\right] \\
& U_{v 1}=i_{b}\left[c_{0}+c_{1} D_{y}-c_{2} \boldsymbol{Q}+\cdots\right] \\
& U_{v 2}=i_{b}\left[c_{0}-c_{1} D_{y}-c_{2} \boldsymbol{Q}+\cdots\right] \quad \text { High order terms }
\end{aligned}
$$

$$
\uparrow \quad \text { can be fairly neglected }
$$

Quadrupolar Term
$\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}$

## Standard Measurement Technique

PU signals as a multipole expansion
$\Sigma_{\text {hor }}\left\{\begin{array}{l}U_{h 1}=i_{b}\left[c_{0}+c_{1} D_{x}+c_{2} \boldsymbol{Q}+\cdots\right] \\ U_{h 2}=i_{b}\left[c_{0}-c_{1} D_{x}+c_{2} \boldsymbol{Q}+\cdots\right]\end{array}\right.$
$\Sigma_{v e r}\left\{\begin{array}{l}U_{v 1}=i_{b}\left[c_{0}+c_{1} D_{y}-c_{2} \boldsymbol{Q}+\cdots\right] \\ U_{v 2}=i_{b}\left[c_{0}-c_{1} D_{y}-c_{2} \boldsymbol{Q}+\cdots\right]\end{array}\right.$

Cancel Dipolar moments Cancel Monopole moment

$$
\begin{gathered}
\Sigma_{\text {hor }}=2 i_{b} c_{0}+2 i_{b} c_{2} \boldsymbol{Q} \\
\Sigma_{v e r}=2 i_{b} c_{0}-2 i_{b} c_{2} \boldsymbol{Q}
\end{gathered} \left\lvert\, \begin{gathered}
\Sigma_{\text {hor }}-\Sigma_{v e r}=4 i_{b} c_{2} \boldsymbol{Q} \\
\text { Normalize by intensity }
\end{gathered} R_{q}=\frac{\Sigma_{\text {hor }}-\Sigma_{v e r}}{\Sigma_{\text {hor }}+\Sigma_{v e r}}=\frac{c_{2}}{c_{0}} \boldsymbol{Q} . ~ \$\right.
$$

## Standard Measurement Technique

PU signals as a multipole expansion
$\Sigma_{\text {hor }}\left\{\begin{array}{l}U_{h 1}=i_{b}\left[c_{0}+c_{1} D_{x}+c_{2} \boldsymbol{Q}+\cdots\right] \\ U_{h 2}=i_{b}\left[c_{0}-c_{1} D_{x}+c_{2} \boldsymbol{Q}+\cdots\right]\end{array}\right.$
$\Sigma_{v e r}\left\{\begin{array}{l}U_{v 1}=i_{b}\left[c_{0}+c_{1} D_{y}-c_{2} \boldsymbol{Q}+\cdots\right] \\ U_{v 2}=i_{b}\left[c_{0}-c_{1} D_{y}-c_{2} \boldsymbol{Q}+\cdots\right]\end{array}\right.$

Cancel Dipolar moments Cancel Monopole moment

$$
\begin{gathered}
\Sigma_{\text {hor }}=2 i_{b} c_{0}+2 i_{b} c_{2} \boldsymbol{Q} \\
\Sigma_{v e r}=2 i_{b} c_{0}-2 i_{b} c_{2} \boldsymbol{Q}
\end{gathered} \left\lvert\, \begin{gathered}
\Sigma_{\text {hor }}-\Sigma_{v e r}=4 i_{b} c_{2} \boldsymbol{Q} \\
\text { Normalize by intensity }
\end{gathered} R_{q}=\frac{\Sigma_{\text {hor }}-\Sigma_{v e r}}{\Sigma_{\text {hor }}+\Sigma_{v e r}}=\frac{c_{2}}{c_{0}} \boldsymbol{Q} . ~ \$\right.
$$

Pretty straightforward... but very challenging!

## Challenges (1)

## Low Quadrupolar Sensitivity

## Analytical 2D Case

## General Case

$$
\begin{aligned}
U_{h 1} & \propto \frac{a}{2 \pi}+\frac{1}{\rho} \frac{2 \sin (a / 2)}{\pi} x \\
& +\frac{1}{\rho^{2}} \frac{\sin (a)}{\pi}\left(\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}\right)+\cdots
\end{aligned}
$$

$$
\begin{gathered}
U_{h 1} \propto c_{0}+c_{1} D_{x}+c_{2} Q+\cdots \\
\frac{c_{2}}{c_{0}} Q \propto\left(\sigma_{\text {eff }} / \rho\right)^{2} \ll 1
\end{gathered}
$$

Quadrupolar moment constitutes only a very small part of the total BPM signal

Typical values: few per milles

## Challenges (1)

## Low Quadrupolar Sensitivity

## Analytical 2D Case

## General Case

$$
\begin{aligned}
U_{h 1} & \propto \frac{a}{2 \pi}+\frac{1}{\rho} \frac{2 \sin (a / 2)}{\pi} x \\
& f \frac{1}{\rho^{2}} \frac{\sin (a)}{\pi}\left(\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}\right)+\cdots
\end{aligned}
$$

channel asymmetries $\xrightarrow{\text { low sensitivity }}$ large offsets

> ideal world symmetric channels $\Sigma_{\text {hor }}=2 i_{b} c_{0}+2 i_{b} c_{2} Q$ $\Sigma_{\text {ver }}=2 i_{b} c_{0}-2 i_{b} c_{2} Q$ $\downarrow$ $Q_{m}=\frac{c_{0}}{c_{2}} \frac{\Sigma_{\text {hor }}-\Sigma_{\text {ver }}}{\Sigma_{\text {hor }}+\Sigma_{\text {ver }}}=Q$

$$
\begin{gathered}
\text { realistic case } \\
\text { small asymmetry } \\
\Sigma_{\text {hor }}=2 a_{h} i_{b} c_{0}+2 a_{h} i_{b} c_{2} Q \\
\Sigma_{\text {ver }}=2 a_{v} i_{b} c_{0}-2 a_{v} i_{b} c_{2} Q \\
\downarrow \\
Q_{m}=\frac{c_{0}}{c_{2}} \frac{\Sigma_{\text {hor }}-\Sigma_{\text {ver }}}{\Sigma_{\text {hor }}+\Sigma_{\text {ver }}} \approx Q+\stackrel{c_{0}}{c_{2}} \frac{\text { offset }}{a_{h}-a_{v}}
\end{gathered}
$$

## Challenges (1)

## Low Quadrupolar Sensitivity

## Analytical 2D Case

$$
\begin{aligned}
U_{h 1} & \propto \frac{a}{2 \pi}+\frac{1}{\rho} \frac{2 \sin (a / 2)}{\pi} x \\
& +\frac{1}{\rho^{2}} \frac{\sin (a)}{\pi}\left(\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}\right)+\cdots
\end{aligned}
$$

## General Case

$$
\begin{gathered}
U_{h 1} \propto c_{0}+c_{1} D_{x}+c_{2} Q+\cdots \\
\frac{c_{2}}{c_{0}} Q \propto\left(\sigma_{\text {eff }} / \rho\right)^{2} \ll 1
\end{gathered}
$$

$\xrightarrow{\text { channel asymmetries } \xrightarrow{\text { low sensitivity }} \text { large offsets }}$

## Example: LHC BPMs

Quad. sensitivity ( $c_{2} / c_{0}$ ) for different types of LHC BPMs

Error considering a cabling discrepancy in one channel

## Challenges (2)

## Parasitic Position Signal

$$
Q=\frac{\sigma_{x}^{2}-\sigma_{y}^{2}}{Q_{\sigma}}+\frac{x^{2}-y^{2}}{Q_{p}}
$$

Typical values in LHC PUs

$$
\begin{aligned}
& {[450 \mathrm{GeV}]}
\end{aligned} \rightarrow \quad Q_{\sigma} \sim 0.30-1.50 \mathrm{~mm}^{2} \mathrm{~m}^{2}-3.3 \mathrm{~mm}^{2}
$$

Even small beam displacements may result in large parasitic signal $Q_{p}$

## Problem - Overview

| Fundamental Limitations | Unfavourable Conditions | Destructive <br> Measurement Effects |
| :---: | :---: | :---: |
| Low quadrupolar sensitivity $U_{h 1} \propto c_{0}+c_{1} D_{x}+c_{2} Q+\cdots$ | asymmetries <br> (electronics, cabling, $\longrightarrow$ <br> geometrical) <br> noise (electronics) $\longrightarrow$ | Beam size information lost in large offsets <br> Low resolution ${ }^{* *}$ |
| Parasitic Position Signal $Q=\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}$ | off-centered beam $\longrightarrow$ | Beam size signal lost in parasitic position signal |

[^0]However, existing BPM acquisition systems typically achieve sufficient resolution.
Example: $\sim 1 \mu \mathrm{~m}$ position resolution $\rightarrow \sim 0.01 \mathrm{~mm}^{2}$ quadrupolar resolution

## Problem - Overview

| Fundamental Limitations | Unfavourable Conditions | Destructive Measurement Effects |
| :---: | :---: | :---: |
| Low quadrupolar sensitivity $U_{h 1} \propto c_{0}+c_{1} D_{x}+c_{2} Q+\cdots$ | asymmetries <br> (electronics, cabling, $\longrightarrow$ <br> geometrical) <br> noise (electronics) $\longrightarrow$ | Beam size information lost in large offsets <br> Low resolution** |
| Parasitic Position Signal $Q=\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}$ | off-centered beam $\longrightarrow$ | Beam size signal lost in parasitic position signal |

[^1]However, existing BPM acquisition systems typically achieve sufficient resolution.
Example: $\sim 1 \mu \mathrm{~m}$ position resolution $\rightarrow \sim 0.01-0.02 \mathrm{~mm}^{2}$ quadrupolar resolution

## Subtract Position Signal

## Direct subtraction

Manipulate PU as a beam position monitor (BPM)

1. Measure the beam position

$$
x_{m}=P\left(\frac{U_{h 1}-U_{h 2}}{U_{h 1}+U_{h 2}}\right) \quad y_{m}=P\left(\frac{U_{v 1}-U_{v 2}}{U_{v 1}+U_{v 2}}\right)
$$

2. Subtract the parasitic signal

$$
Q_{\sigma, m}=Q-x_{m}^{2}+y_{m}^{2}
$$

## Subtract Position Signal

## Direct subtraction

Manipulate PU as a beam position monitor (BPM)

1. Measure the beam position

$$
x_{m}=P\left(\frac{U_{h 1}-U_{h 2}}{U_{h 1}+U_{h 2}}\right) \quad y_{m}=P\left(\frac{U_{v 1}-U_{v 2}}{U_{v 1}+U_{v 2}}\right)
$$

2. Subtract the parasitic signal

$$
Q_{\sigma, m}=Q-x_{m}^{2}+y_{m}^{2}
$$

Is this subtraction sufficient to cancel the position signal?

## Subtract Position Signal

## Direct subtraction

Manipulate PU as a beam position monitor (BPM)

1. Measure the beam position, with certain accuracy

$$
x_{m}=P\left(\frac{U_{h 1}-U_{h 2}}{U_{h 1}+U_{h 2}}\right) \quad y_{m}=P\left(\frac{U_{v 1}-U_{v 2}}{U_{v 1}+U_{v 2}}\right)
$$

2. Subtract the parasitic signal

$$
Q_{\sigma, m}=Q-x_{m}^{2}+y_{m}^{2}
$$

Is this subtraction sufficient to cancel the position signal?

## Subtract Position Signal

## Direct subtraction

Manipulate PU as a beam position monitor (BPM)

1. Measure the beam position, with certain accuracy

$$
x_{m}=x+\Delta \boldsymbol{x} \quad y_{m}=y+\Delta \boldsymbol{y}
$$

2. Subtract the parasitic signal

$$
Q_{\sigma, m}=Q-x_{m}^{2}+y_{m}^{2}
$$

## Towards a Movable PU..

## Direct subtraction

Manipulate PU as a beam position monitor (BPM)

1. Measure the beam position, with certain accuracy

$$
x_{m}=x+\Delta x \quad y_{m}=y+\Delta y
$$

2. Subtract the parasitic signal

$$
Q_{\sigma, m}=Q-x_{m}^{2}+y_{m}^{2}
$$

## Remaining Error: <br> $$
Q_{x, r e m} \approx 2 x \Delta x
$$

Subtraction by Alignment (Movable PU)

1. Measure the beam position, with certain accuracy

$$
x_{m}=x+\Delta x \quad y_{m}=y+\Delta y
$$

2. Align PU according to $\left(x_{m}, y_{m}\right)$ $x^{\prime} \approx \Delta x$

$$
y^{\prime} \approx \Delta y
$$

$$
\begin{aligned}
& \text { Remaining Error: } \\
& Q_{x, \text { rem }} \approx \Delta x^{2}
\end{aligned}
$$

## Towards a Movable PU..

## Direct subtraction (Fixed PU)

Measure \& subtract beam position

Subtraction by Alignment (Movable PU)
Measure beam position
\& align PU

Remaining Error:
$\Omega x, x^{2}$

## Example

Remaining parasitic signal considering offset, $o$, \& scaling, $a$, errors in position measurement:

$$
\Delta x=o+a x
$$

## Problem - Overview

[^3]
## Aperture Scans

Consider a (theoretical) circular PU able to change its aperture $\rho$
$\Sigma_{h o r} \propto \frac{a}{2 \pi}+\frac{1}{c_{0}} \frac{\sin (a)}{\pi} Q+\cdots \quad c_{2} \quad\left(v_{2}\right.$

## Aperture Scans

## Aperture Scans

## Aperture Scans

## Aperture Scans

Consider a (theoretical) circular PU able to change its aperture $\rho$

$$
\Sigma_{h o r} \propto \frac{a}{2 \pi}+\frac{\frac{1}{\rho^{2}} \frac{\sin (a)}{\pi}}{c_{0}}
$$

Monopole \& Quadrupolar moments change differently w.r.t. to the aperture change
$\xrightarrow{\text { stable beam }}$
Calibrate PU system (e.g. electronics/ cabling)

Consider a pair of Hor. \& Ver. collimators

Experimental Setup

## A New Approach: The d-Norm Method

Consider a movable PU, able to change the aperture

Consider some asymmetry between the Hor. \& Ver. channels

$$
\begin{aligned}
\Sigma_{h} & =a_{h} i_{b}\left(c_{0}+c_{2} Q\right) \\
\Sigma_{v} & =a_{v} i_{b}\left(c_{0}-c_{2} Q\right)
\end{aligned}
$$

## A New Approach: The d-Norm Method

Consider a movable PU, able to change the aperture

Reference measurement

Consider some asymmetry between the Hor. \& Ver. channels

$$
\begin{aligned}
\Sigma_{h} & =a_{h} i_{b}\left(c_{0}+c_{2} Q\right) \\
\Sigma_{v} & =a_{v} i_{b}\left(c_{0}-c_{2} Q\right)
\end{aligned}
$$

Perform 2 measurements with different apertures

## A New Approach: The d-Norm Method

Consider a movable PU, able to change the aperture

Reference measurement

Consider some asymmetry between the Hor. \& Ver. channels

$$
\begin{aligned}
\Sigma_{h} & =a_{h} i_{b}\left(c_{0}+c_{2} Q\right) \\
\Sigma_{v} & =a_{v} i_{b}\left(c_{0}-c_{2} Q\right)
\end{aligned}
$$

Perform 2 measurements with different apertures

$$
S_{h}=\frac{\Sigma_{h}}{\Sigma_{h, \text { ref }}}=\frac{i_{b}(r+Q)}{i_{b, \text { ref }}\left(r_{\text {ref }}+Q\right)}
$$

$$
S_{v}=\frac{\Sigma_{v}}{\Sigma_{v, \text { ref }}}=\frac{i_{b}(r-Q)}{i_{b, \text { ref }}\left(r_{\mathrm{ref}}-Q\right)}
$$

## A New Approach: The d-Norm Method

Consider a movable PU, able to change the aperture

Reference measurement

Consider some asymmetry between the Hor. \& Ver. channels

$$
\begin{aligned}
\Sigma_{h} & =a_{h} i_{b}\left(c_{0}+c_{2} Q\right) \\
\Sigma_{v} & =a_{v} i_{b}\left(c_{0}-c_{2} Q\right)
\end{aligned}
$$

Perform 2 measurements with different apertures

$$
S_{h}=\frac{\Sigma_{h}}{\Sigma_{h, \text { ref }}}=\frac{i_{b}(r+Q)}{i_{b, \text { ref }}\left(r_{\text {ref }}+Q\right)} \quad S_{v}=\frac{\Sigma_{v}}{\Sigma_{v, \text { ref }}}=\frac{i_{b}(r-Q)}{i_{b, \text { ref }}\left(r_{\text {ref }}-Q\right)}
$$

$$
2^{\text {nd }} \text { normalization } \quad \downarrow \text { normalize intensity }
$$

$$
\mathrm{R}=\frac{S_{h}}{S_{v}}=\frac{r+Q}{r-Q} \frac{r_{\mathrm{ref}}-Q}{r_{\mathrm{ref}}+Q}
$$

## A New Approach: The d-Norm Method

Consider a movable PU, able to change the aperture

Reference measurement

Consider some asymmetry between the Hor. \& Ver. channels

$$
\begin{aligned}
\Sigma_{h} & =a_{h} i_{b}\left(c_{0}+c_{2} Q\right) \\
\Sigma_{v} & =a_{v} i_{b}\left(c_{0}-c_{2} Q\right)
\end{aligned}
$$

Perform 2 measurements with different apertures

$$
S_{h}=\frac{\Sigma_{h}}{\Sigma_{h, \text { ref }}}=\frac{i_{b}(r+Q)}{i_{b, \text { ref }}\left(r_{\text {ref }}+Q\right)} \quad S_{v}=\frac{\Sigma_{v}}{\Sigma_{v, \text { ref }}}=\frac{i_{b}(r-Q)}{i_{b, \text { ref }}\left(r_{\text {ref }}-Q\right)}
$$

$2^{\text {nd }}$ normalization
normalize intensity

$$
\mathrm{R}=\frac{S_{h}}{S_{v}}=\frac{r+Q}{r-Q} \frac{r_{\mathrm{ref}}-Q}{r_{\mathrm{ref}}+Q}
$$

$Q$ obtained by double-normalization ( $d$-Norm)

$$
Q \approx \frac{r r_{r e f}}{r-r_{v, r e f}} \frac{1-R}{1+R}
$$

## First Observations

## Experimental Setup: Collimator BPMs

- Dioded-based electronics (DOROS) - high resolution (better than $1 u m$ for position measurements)
- BPM signals are processed separately
- Select a pair of Hor. -Ver. Collimators to form 4-electrodes PUs
- 4 PUs in total by combining upstream/downstream collimator BPMs

## First Observations

$1^{\text {st }}$ phase: PU alignment

- Main Axis: direct alignment using position readings
- Secondary Axis: quadrupolar measurements

$$
Q=\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}
$$

During scans on the
secondary axis

$$
\begin{array}{ll}
Q_{h}=Q_{h, 0}-y^{2} & \text { Hor. collimator } \\
Q_{v}=Q_{v, 0}+x^{2} & \text { Ver. collimator }
\end{array}
$$

Alignment process on the secondary axis

## First Observations

$1^{\text {st }}$ phase: PU alignment

- Main Axis: direct alignment using position readings
- Secondary Axis: quadrupolar measurements

$$
Q=\sigma_{x}^{2}-\sigma_{y}^{2}+x^{2}-y^{2}
$$

During scans on the secondary axis
$Q_{h}=Q_{h, 0}-y^{2} \quad$ Hor. collimator
$Q_{v}=Q_{v, 0}+x^{2} \quad$ Ver. collimator

Alignment process on the secondary axis

Scan around beam center after alignment

## Last Point: Differential measurements

Promising differential measurements during PU alignment, during ADT blow-up

## Last Point: Differential measurements

Promising differential measurements during PU alignment, during ADT blow-up

..and during the energy ramp

## Emittance Measurements During the Ramp

12 BPMs all around LHC

Absolute change on the geometric emittance

- Combine (at least) 2 BPMs with different beta functions

$$
\begin{aligned}
& \Delta Q^{(1)}=\beta_{x}^{(1)} \Delta \varepsilon_{x}-\beta_{y}^{(1)} \Delta \varepsilon_{y} \\
& \Delta Q^{(2)}=\beta_{x}^{(2)} \Delta \varepsilon_{x}-\beta_{y}^{(2)} \Delta \varepsilon_{y}
\end{aligned}
$$

start squeezing

## Summary

- Quadrupolar Measurements
> simple concept but very challenging in reality
- Fundamental Limitations
$>$ Low quadrupolar sensitivity $\rightarrow$ large offsets
$>$ Parasitic Position Signal -> big errors when beam is displaced
- Movable PUs
$>$ Sufficiently cancel position signal (direct subtraction do not work for large beam displacements)
> Calibrate the measurements system via aperture scans
- Differential Measurements
> Use of existing BPM technologies
> Promising results during the energy ramp

## Differential vs Absolute Error

## What about Non-Linearities?

Active components may introduce offsets/ non-linear terms

$$
O=a_{0}+a_{1} I+a_{2} I^{2}
$$

d-Norm method is optimized to cancel linear asymmetries (in the whole channel)
$O_{h}=a_{1} I_{h}+a_{2} I_{h}{ }^{2} \quad O_{v}=a_{1, v} I_{v}$

## Further Tests

- More samples
- Cover wide aperture range
- Reconstruct uncertainties behaviour
- Error of standard method dominated by linear asymmetry.
- Much smaller deviations using the d-Norm approach
- Further studies to understand the small discrepancies of dNorm method

## d-Norm Method: More Studies

- More samples
- Cover wide aperture range
- Reconstruct uncertainties behaviour

Error in differential aperture measurement

Error due to offset asymmetries

## Identifying Uncertainty

Aperture measurement error (differential)

## Identifying Uncertainty

## Identifying Uncertainty

Additional overview via the "standard method"

## Estimation assuming

 asymmetries:- $a_{0}=0.005$
- $a_{1}=0.02$
- $a_{2}=0.005$

Error of standard method dominated by linear asymmetry.

## d-Norm Method - Modified

## d-Norm Method - Modified

## d-Norm Method - Modified

## Emittance Measurement

Consider two PUs at different, low dispersion, locations

$$
\begin{aligned}
& Q^{(1)}=\beta_{x}^{(1)} \varepsilon_{x}-\beta_{y}^{(1)} \varepsilon_{y} \\
& Q^{(2)}=\beta_{x}^{(2)} \varepsilon_{x}-\beta_{y}^{(2)} \varepsilon_{y}
\end{aligned}
$$

The emittances can be derived by solving the above linear system

[^0]:    ** Noise from electronics may significantly affect the quadrupolar measurements.

[^1]:    ** Noise from electronics may significantly affect the quadrupolar measurements.

[^2]:    ** Noise from electronics may significantly affect the quadrupolar measurements.
    However, existing BPM acquisition systems typically achieve sufficient resolution.
    Example: $\sim 1 \mu \mathrm{~m}$ position resolution $\rightarrow \sim 0.01-0.02 \mathrm{~mm}^{2}$ quadrupolar resolution

[^3]:    ** Noise from electronics may significantly affect the quadrupolar measurements. However, existing BPM acquisition systems typically achieve sufficient resolution.
    Example: $\sim 1 \mu \mathrm{~m}$ position resolution $\rightarrow \sim 0.01-0.02 \mathrm{~mm}^{2}$ quadrupolar resolution
