

1.

What problem are we trying to solve

2.

 e3 Definitions

3.

Standardised Interface
for
Epics Modules

4.

 e3 Environment

What is e3 Trying to Do

IOC

EPICS Base
7.0.3.1

Asyn
R4-37

StreamDevice
2.8.10

IOC

EPICS Base
7.0.6

Autosave
R5-10-2

Asyn
R4-42

Modbus
3.2.0

IOC

EPICS Base
3.13.9

Asyn
R2-1

- Lots of code from many sources
- Trying to keep it all up-to-date
- Trying to keep track of what is being used, by whom
- Maintaining site configuration challenging
- Fix so-called "dependency hell"
- How to ensure that everything is under version control and easy to deploy

An IOC:

- Standard executable entrypoint (iocsh.bash, loads softlocPVA)
- Runs a configured startup script st.cmd
- Dynamically loads all necessary functionality
- Generated by external configuration management tool

```
$ iocsh.bash st.cmd
```

```
require module1
require module2

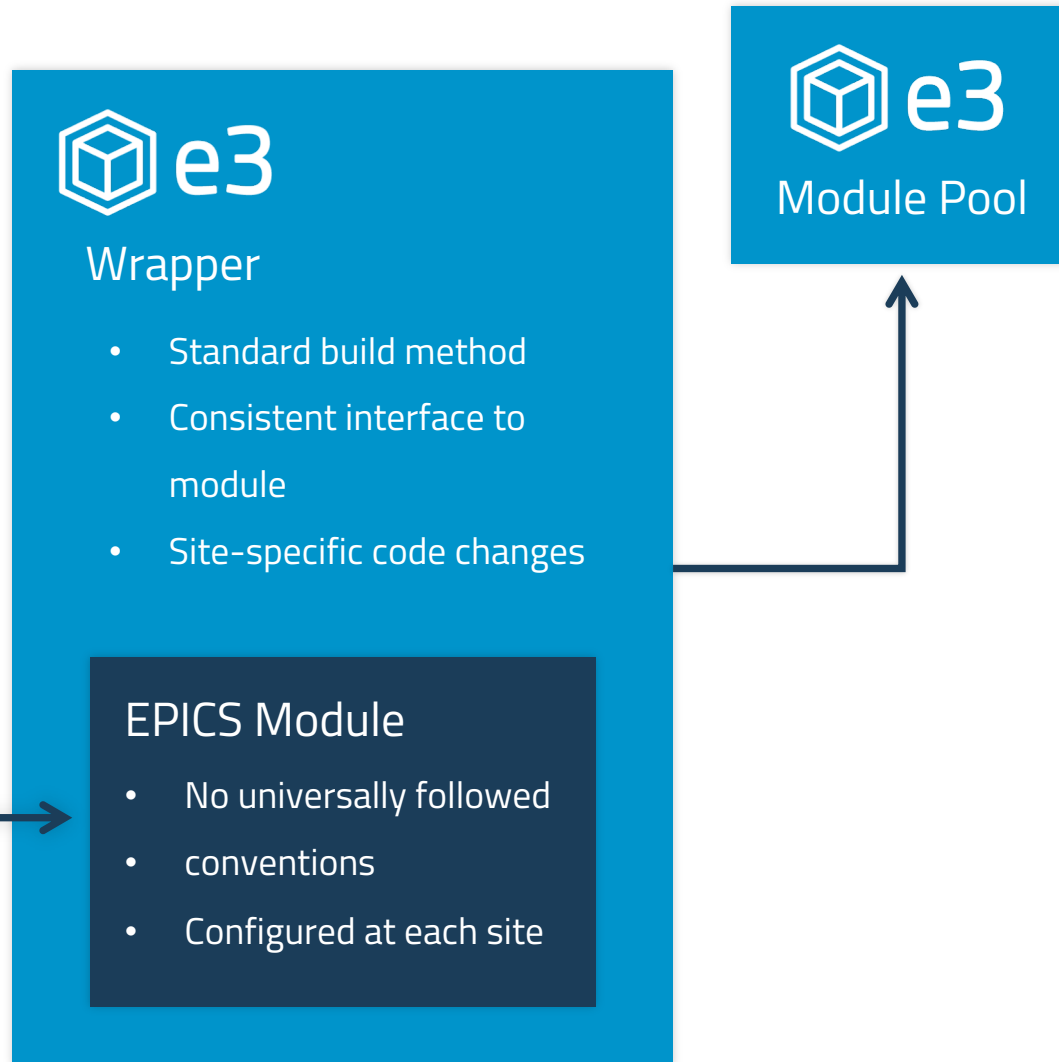

epicsEnvSet(PARAM, value1)
iocshLoad($(module1_DIR)/Config.iocsh, "PARAM=$(PARAM)")

epicsEnvSet(PARAM, value2)
iocshLoad($(module1_DIR)/config.iocsh, "PARAM=$(PARAM)")

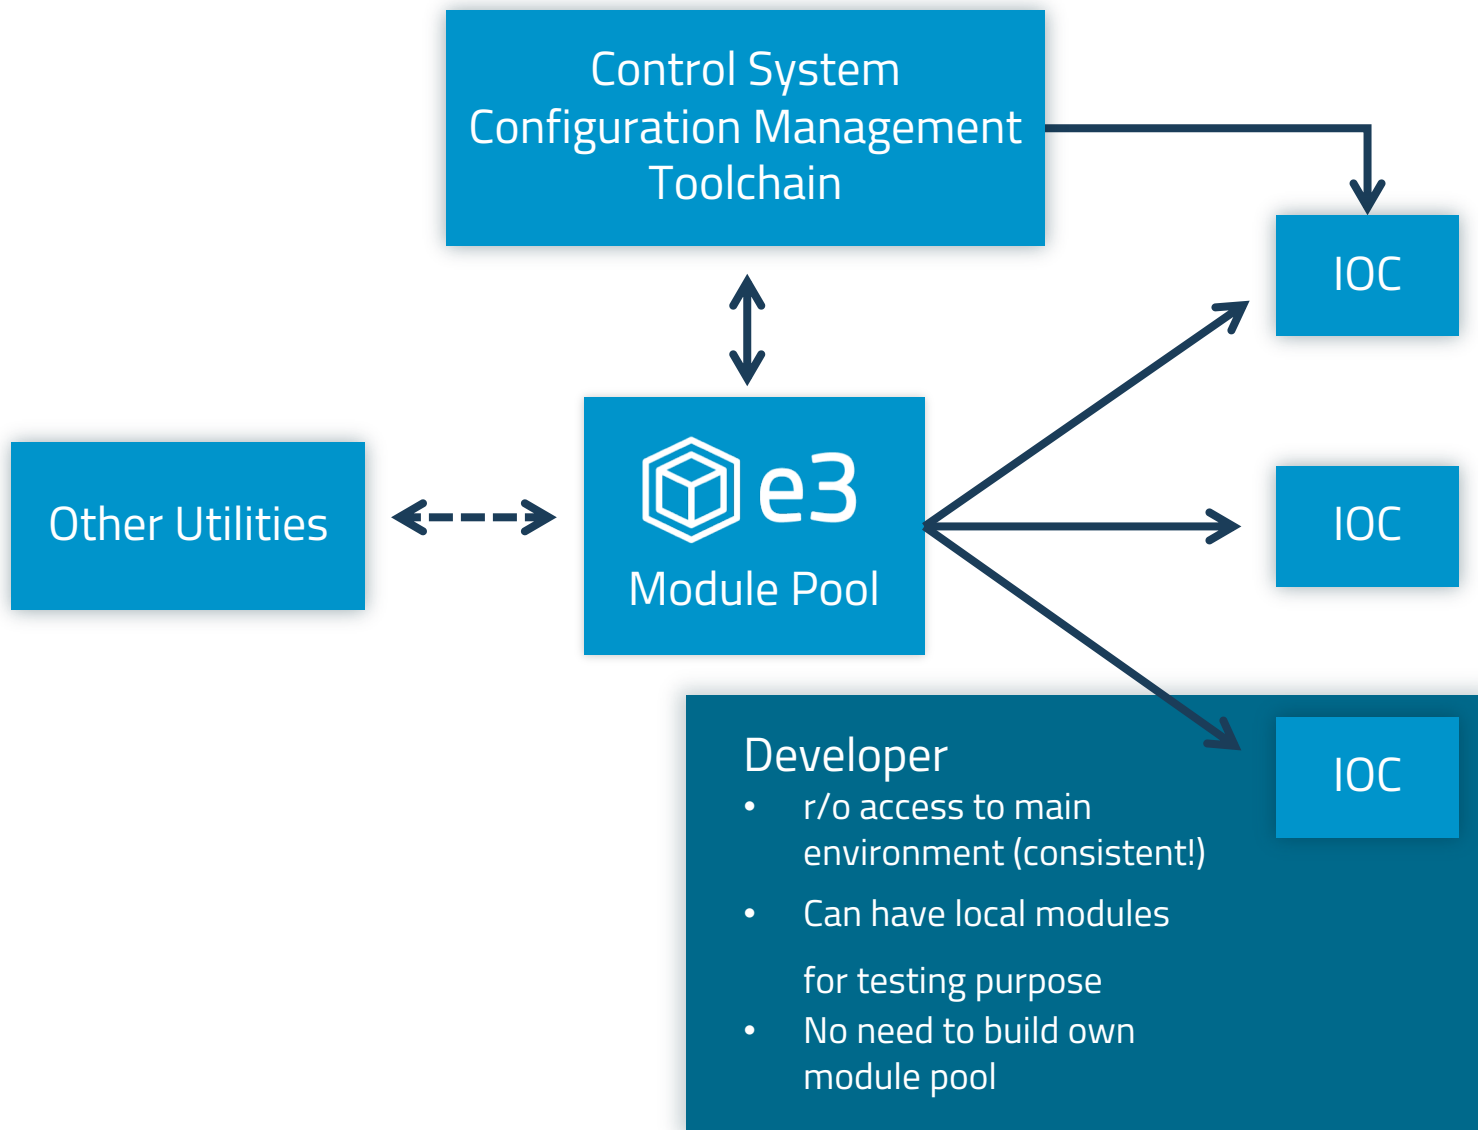

iocshLoad($(module2_DIR)/module_2.iocsh)
```

API:

- Restricted interface to simplify running IOCs
- Exposes parameters to control system configuration management utilities
- Configuration is done by system expert, not necessarily the IOC integrator
- No need to explore inner workings of all modules

- Provides a standard interface between EPICS modules and IOCs
- Version controlled site-specific changes (db, sources, snippets, anything!) without needing to push to community repositories
- Limited pool of modules (avoids combinatorial explosion)
- Guaranteed consistent environment
- Focus on “high-level” dependencies: only need to specify StreamDevice version, no need to specify Asyn as well

- Single pool of modules maintained by a dedicated team
- Regular review as a part of deployment in order to ensure high code quality
- Supports multiple version of EPICS base
- Supports multiple consistent environments
