

# Concept and Design of an Extensible Middle-Layer Application Framework for Accelerator Operation and Development

Talk at the 19th Biennial International Conference on Accelerator and Large Experimental Physics Control Systems (ICALEPCS'23)

M. Schütte, A. Grünhagen, J. Georg, H. Schlarb  
Cape Town, ZA – October 9<sup>th</sup>, 2023

# Contents

... of today's presentation

**01 Motivation**

**02 Concept for an Extensible Middle Layer Application Framework (ExMAF)**

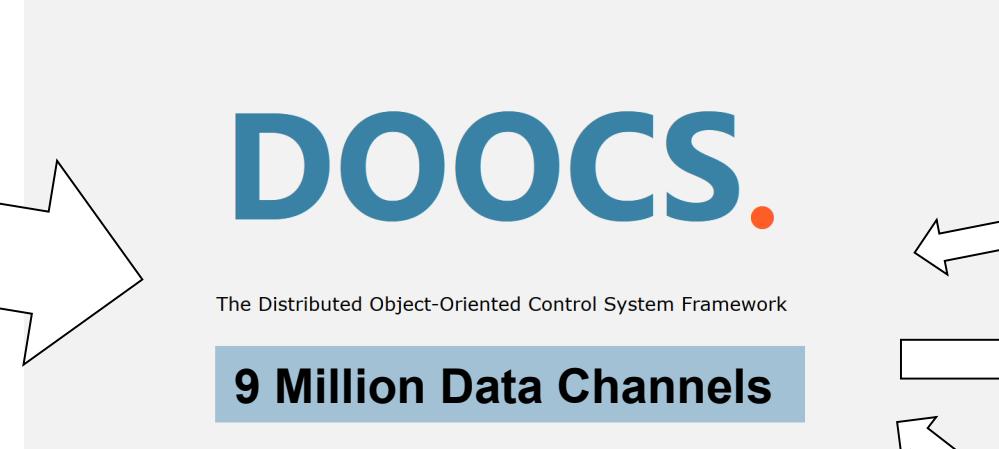

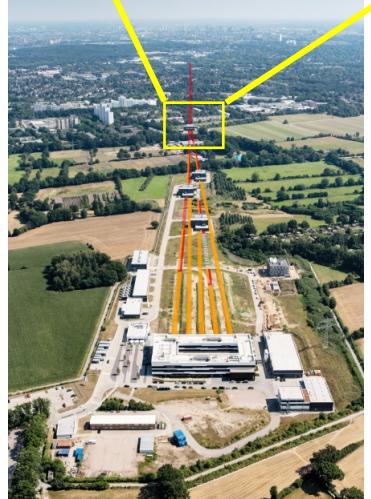

**03 Implementation for DOOCS (DxMAF)**

**04 First Experiences from European XFEL & FLASH**

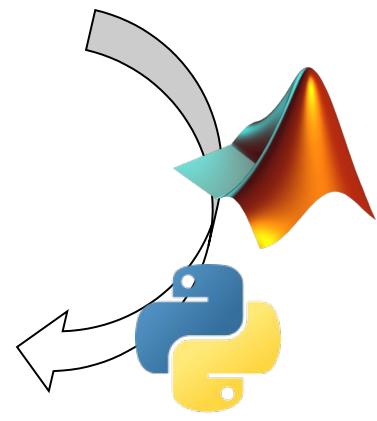

# 01 Motivation

# Problems We See

... in accelerator R&D and operation

# Problems We See

... in accelerator R&D and operation

Many middle-layer applications & scripts are..

- quickly hacked together,
- done from scratch over and over,
- not shared,
- buggy,
- inefficient,
- not maintained.

# 02 An Extensible Middle-Layer Application Framework (ExMAF)

# The Vision

... for middle-layer application development

## Easy Configuration

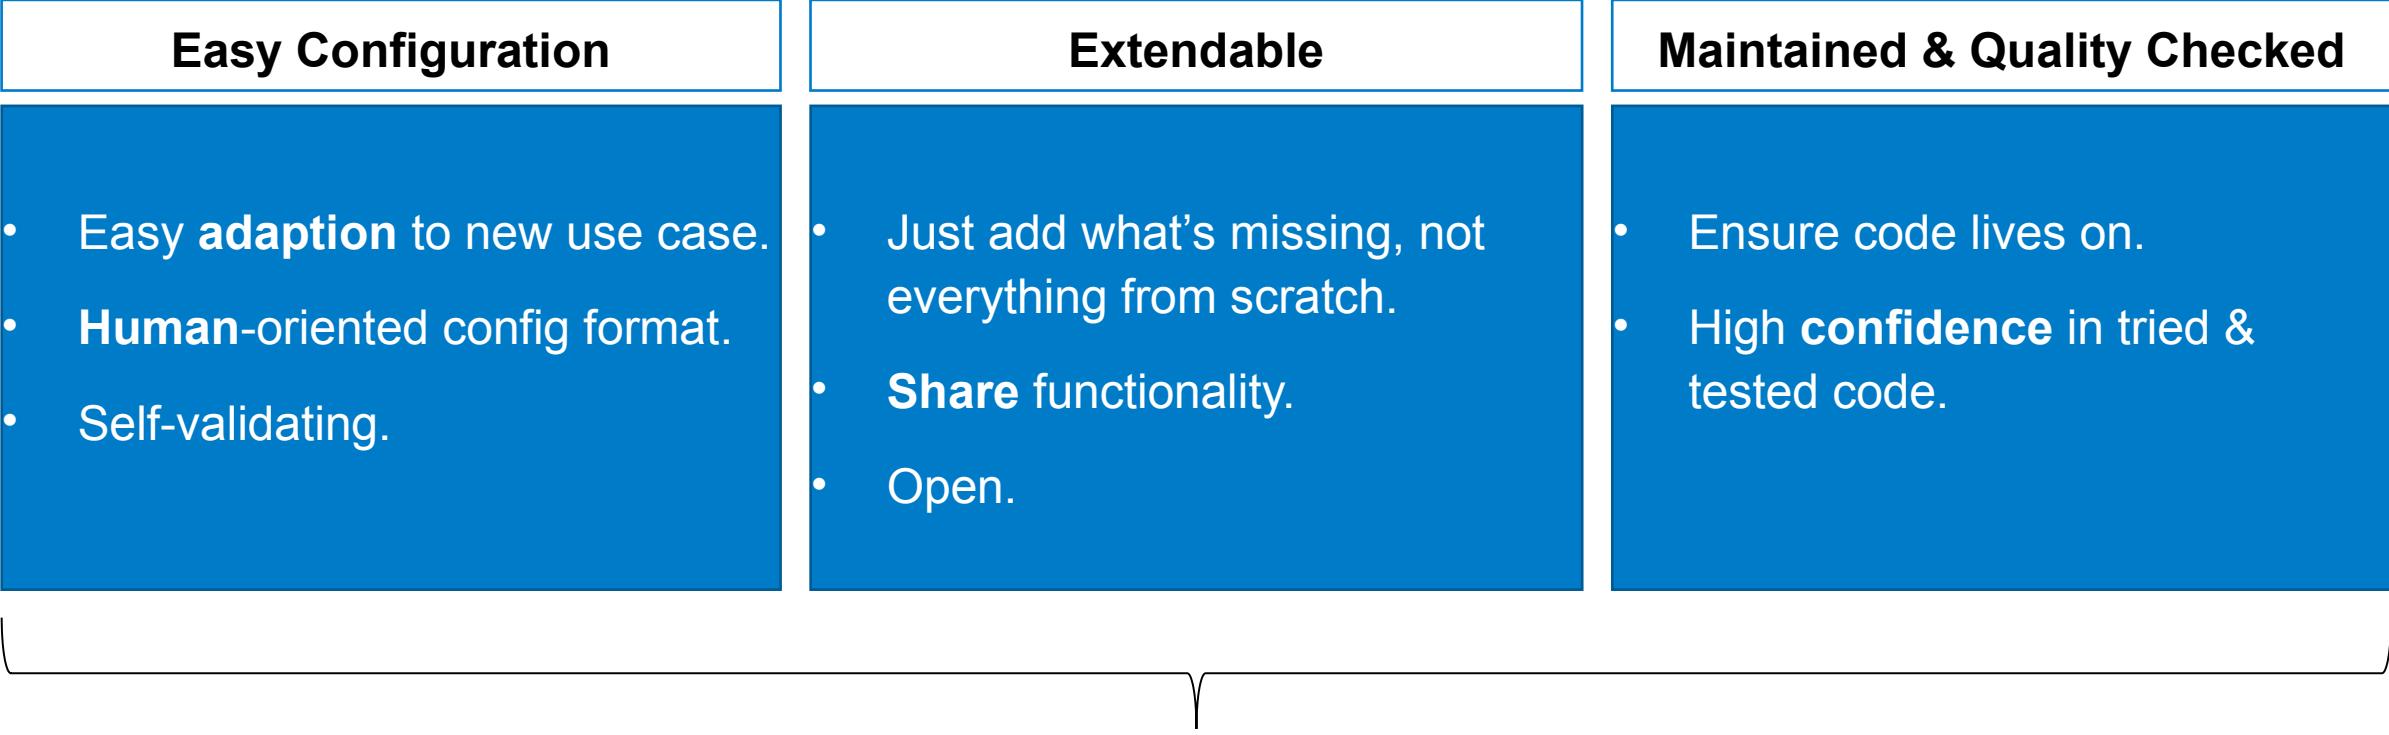

- Easy **adaption** to new use case.
- **Human**-oriented config format.
- Self-validating.

## Extendable

- Just add what's missing, not everything from scratch.
- **Share** functionality.
- Open.

## Maintained & Quality Checked

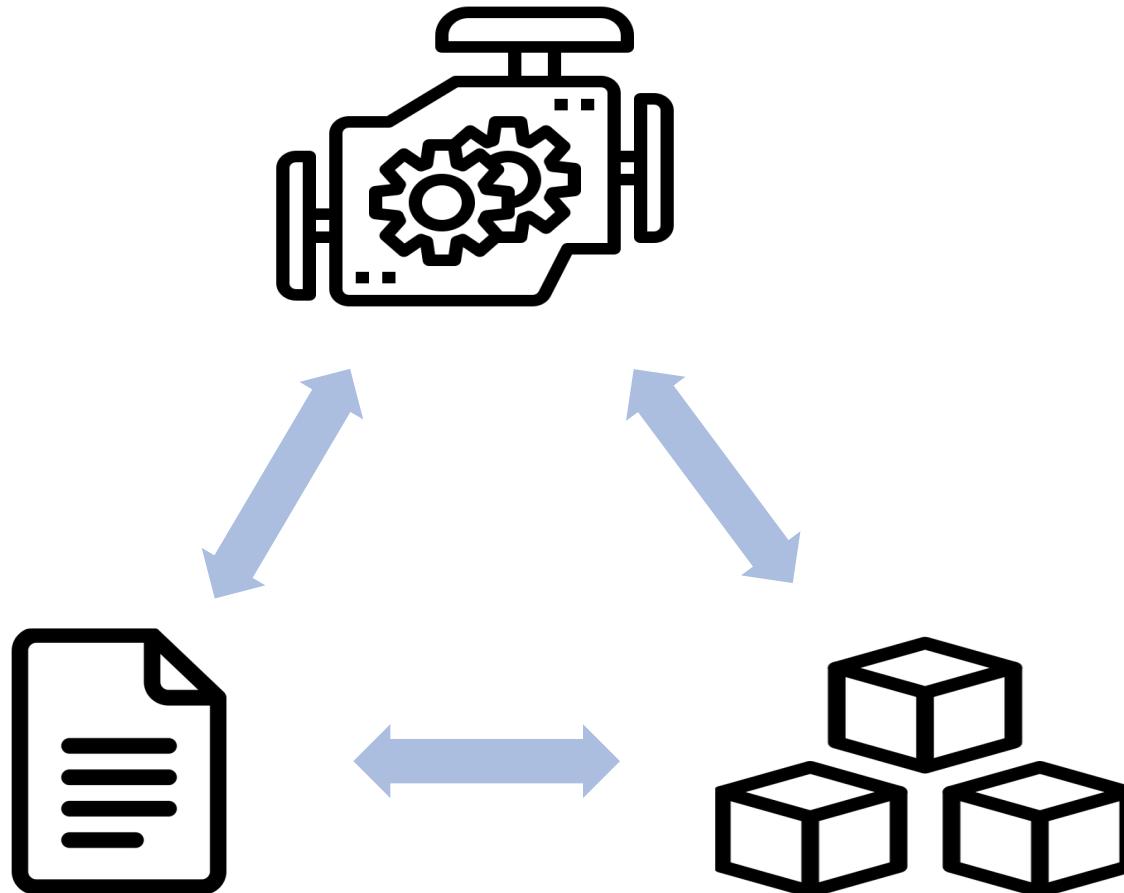

- Ensure code lives on.
- High **confidence** in tried & tested code.

ExMAF

# Three Pillars of ExMAF

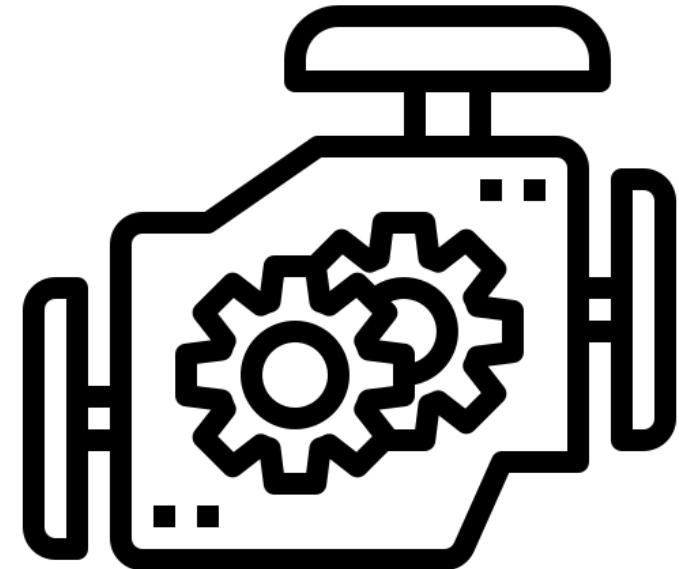

... core, configuration and modules

# Core

## ... bootstrapping & data piping

- Read & validate configuration file.
- Load and instantiate modules.
- Pipe data from control system to modules.
- Pipe messages between modules.

# Configuration File

... application specification

```
# DxMAF configuration file
# Defines a simple trip event logger for high jitter events
extensions: ./dxmaf/extensions
duration: 14d
# stop_time: 2042-01-01T00:00:00
```

# Configuration File

... application specification

```
# DxMAF configuration file
# Defines a simple trip event logger for high jitter events

extensions: ./dxmaf/extensions

duration: 14d
# stop_time: 2042-01-01T00:00:00

application:
- type: ThresholdChecker
  channels:
  - XFEL SYNC/LASER LOCK.XL0/XTIN.ML01/CURRENT_INPUT_JITTER.RD
args:
  lower_limit: -inf
  upper_limit: 20
  topics: high_jitter
```

# Configuration File

... application specification

```
# DxMAF configuration file
# Defines a simple trip event logger for high jitter events

extensions: ./dxmaf/extensions

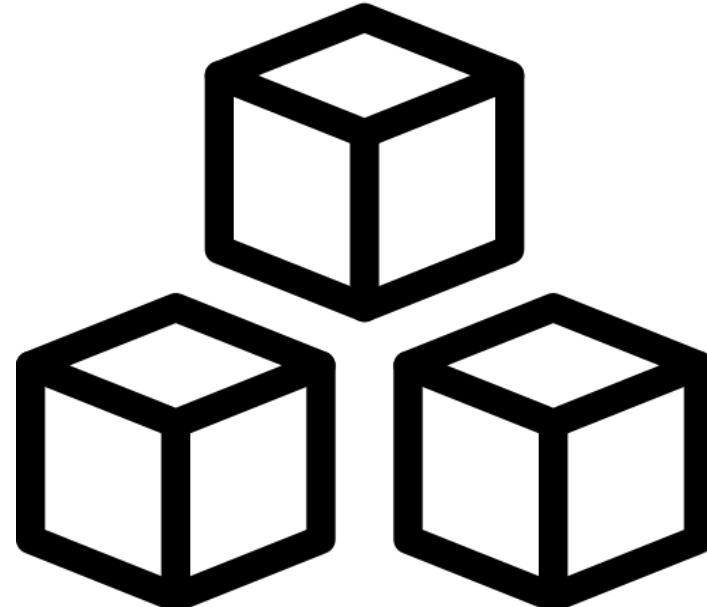

duration: 14d
# stop_time: 2042-01-01T00:00:00

application:
- type: ThresholdChecker
  channels:
  - XFEL SYNC/LASER LOCK.XL0/XTIN.ML01/CURRENT_INPUT_JITTER.RD
  args:
    lower_limit: -inf
    upper_limit: 20
    topics: high_jitter
- type: NpyRingFileWriter
  channels:
  - XFEL SYNC/LASER LOCK.XL0/XTIN.ML01/CURRENT_INPUT_JITTER.RD
  - XFEL SYNC/LASER LOCK.XL0/XTIN.ML01/0XC_IN.SPEC
  - XFEL SYNC/LASER LOCK.XL0/XTIN.ML01/LOCK_STATUS.VALUE.RD
  args:
    output_dir: high_jitter_trip_%Y-%m-%d_%H%M%S
    ring_file_size: 1024
    memory_buffering: true
  topics:
  - high_jitter
```

# Modules

... independent functionality blocks

- Independent code plug-ins (e.g. Python class).
- Implement **interfaces** to receive data from control system automatically from core.
- Module-module communication with **named pipes**.
- Easy to get started with module development, or
- Use **module library** to plug together app.
- Examples: **ThresholdChecker**, EmailDispatcher, FileWriter, GridScanner

# 03 Implementation for DOOCS (DxMAF)

# Modules in DxMAF

... implemented or WIP

## ThresholdChecker

- Compares all data channels against threshold.
- Emits latched signal when limits exceeded.

## NpyFileWriter / NpyRingFileWriter

- Writes data channels to NPY files.
- On signal, closes files and continues in new files.

## EmailDispatcher

- On signal, prints signal context to to configured E-Mail address.

## SpectrumChecker

- Computes PSD estimate.
- Emits signal when integral over frequency bounds exceeds threshold.

## FileMover

- On signal, moves files to configured destination.

## CommandRunner

- On signal, executes system call.
- Signal context can be used as arguments.

# Configuration Schema Validation

... avoiding “bad surprises”

```
from dxmaf.data_subscriber import DataSubscriber
from dxmaf.event_publisher import EventPublisher

class ThresholdChecker(DataSubscriber,
EventPublisher):
    """<docstring>"""

    def __init__(self, channels: Set[str], topics: Set[str], lower_limit: float, upper_limit: float,
spectrum_mode: bool = False):
        """<docstring>"""

        DataSubscriber.__init__(self, channels)
        EventPublisher.__init__(self, topics)

        self.lower_limit = lower_limit
        self.upper_limit = upper_limit
```

- type: ThresholdChecker  
channels:  
- XFEL.SYNC/LASER.LOCK.XL0/XTIN.ML01/...  
args:  
lower\_limit: -inf  
upper\_limit: 20  
topics: high\_jitter

Optional parameter omitted.

- YAML schema is automatically generated for modules (strictYAML).
- Python type hints allow type validation.
- Avoids unnoticed configuration errors.

# 04 First Experiences from European XFEL and FLASH

# Projects that Benefitted from DxMAF

... since 2021

## A. Grünhagen et al. – “*Fault Analysis of the Beam Acceleration Control System at the European XFEL using Data Mining*” (2021)

- 100 data channels from
- 25 LLRF stations
- Fault analysis

## Optical Synchronization Team (MSK)

- Snapshots for training pred. maintenance models
- Post mortem trip / failure analysis

## Machine Control Systems Group

- Long-term data scraping for Klystrons
- Fault detection and analysis

## Machine Beam Controls Group

- Seismic influence on European XFEL & FLASH
- Earthquakes Turkey & Morocco

# 05 Conclusion

# Conclusion

... almost done

## Summary

- Modular middle-layer application framework concept.
- Reusable & reliable code.
- Less redundant work for scientists.
- Positive feedback from users.

## Outlook

- Stable 1.0 release.
- Data pipelines.
- Support for other control systems?

# Thank you!
