

# Nitrogen gas-jet curtain for windowless helium gas cell equipped with differential pumping systems

RIKEN Nishina accelerator based science center  
Hiroshi Imao

# **Outline**

## **1. SRILAC and DPS at RIBF**

- Introduction of SRILAC
- Differential pumping system for SRILAC

## **2. N<sub>2</sub> gas-jet curtain**

- Concept
- Application in He stripper
- Application in DPS for GARIS

## **3. Summary and future prospects**

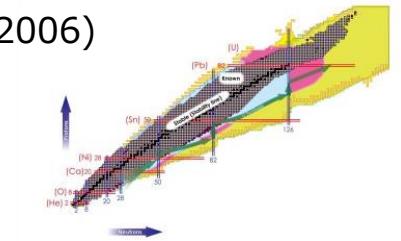

## RIBF

# RIKEN RI beam factory (RIBF) and SRILAC

Cyclotron-based Heavy-ion accelerator for in-flight RI beams (since 2006)

Super conducting ring cyclotron (SRC) is a main device.

Acceleration of **ALL** ions up to 345 MeV/u (70% of c) in **CW** mode

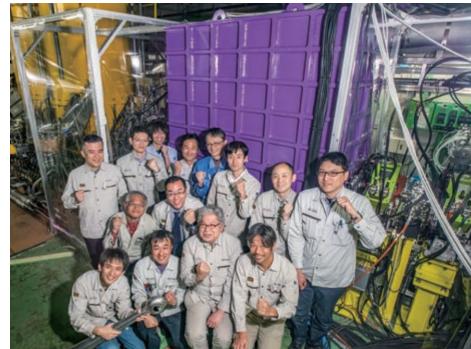

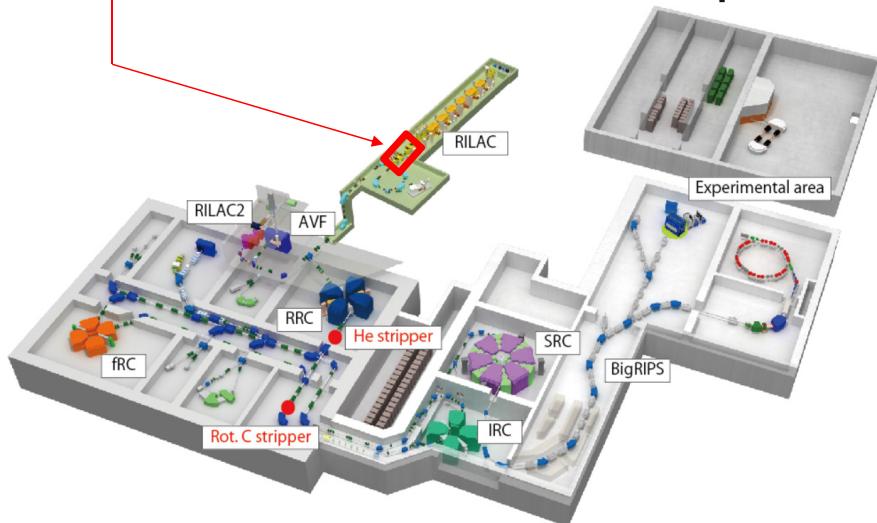

## SRILAC

Superconducting linac, SRILAC, has been operated since 2020

Energy upgrade for superheavy element search (**GARISIII**) and medical RI productions

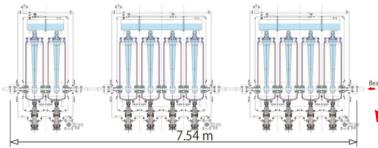

Should be installed **in limited space** between existing NC-linac (RILAC) and HEBT

SRILAC parameters	
frequency [MHz]	73
operating mode	C.W.
# of cryomodules	3
# of cavities	10
total length [m]	7.45
E inj [MeV/u]	3.6
E out [MeV/u]	6.5
Eacc [MV/m]	6.8

## SRILAC

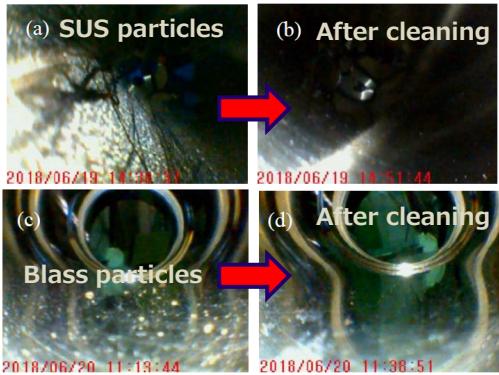

$<\sim 10^{-8}$  Pa

## HEBT

$10^{-4}$  Pa~ $10^{-6}$  Pa

destructive diag., slits,  
C-foil stripper

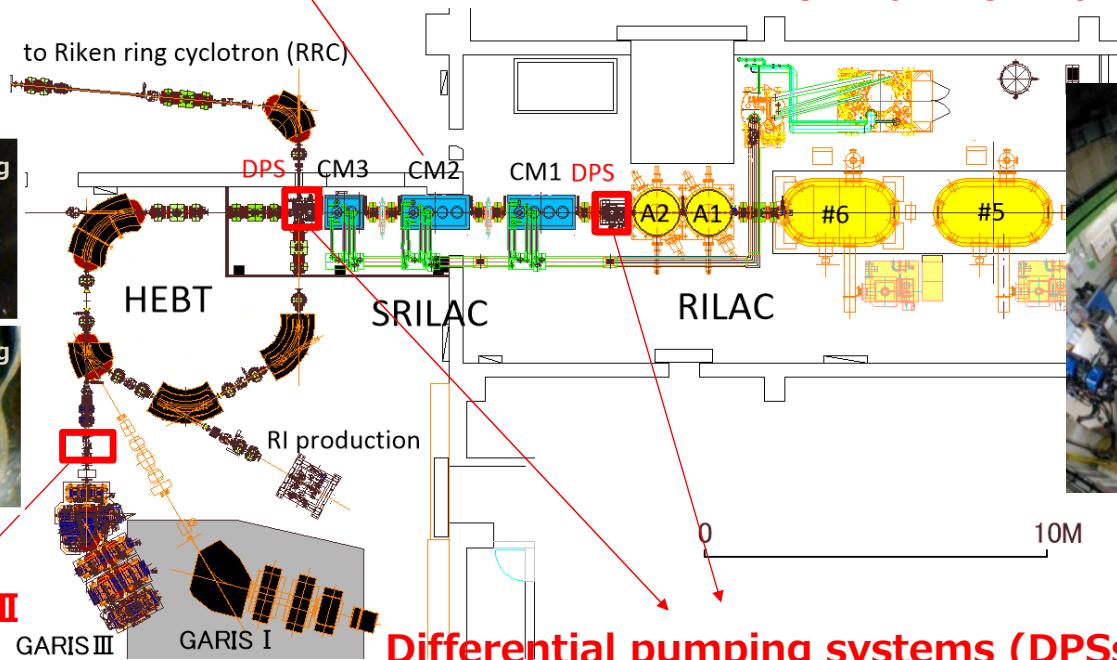

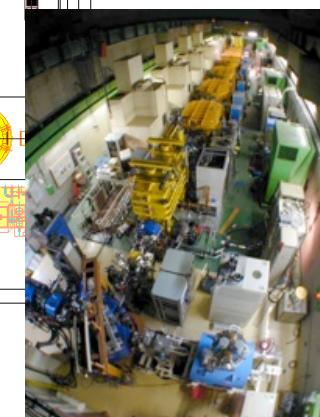

## Configuration of SRILAC and DPSs

### RILAC

(40-years old)

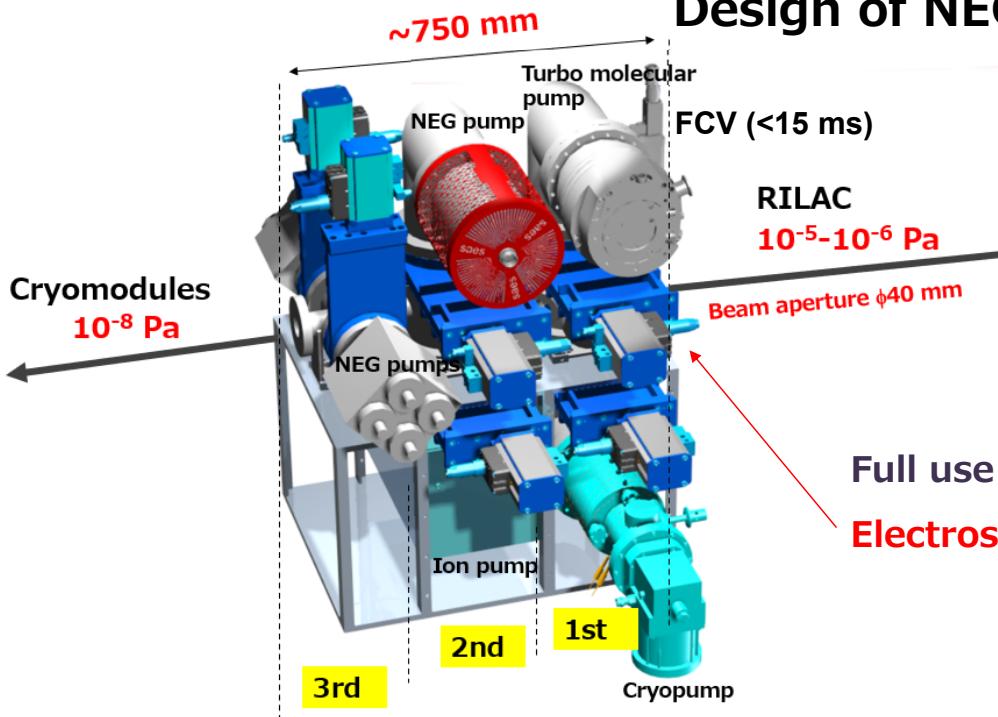

$10^{-4}$  Pa~ $10^{-6}$  Pa

GARIS III experiment (SHE #119 and #120)  
He gas ( $\sim 100$  Pa, windowless target)

DPSs mitigate sudden changes of vacuum and particle conditions  
Allowed space is only 80 cm

# Design of NEG-based DPS for SRILAC

NEG: Non-evaporable getter pump

## NEG-based 3-stage DPS

1st: TMP+Dry pump & CRP

2nd: Ion pump & HT-NEG

3rd: HV-NEG

Full use of low-particle NEG of ZAO alloy (SAES)  
Electrostatic particle suppressor at the 1st stage

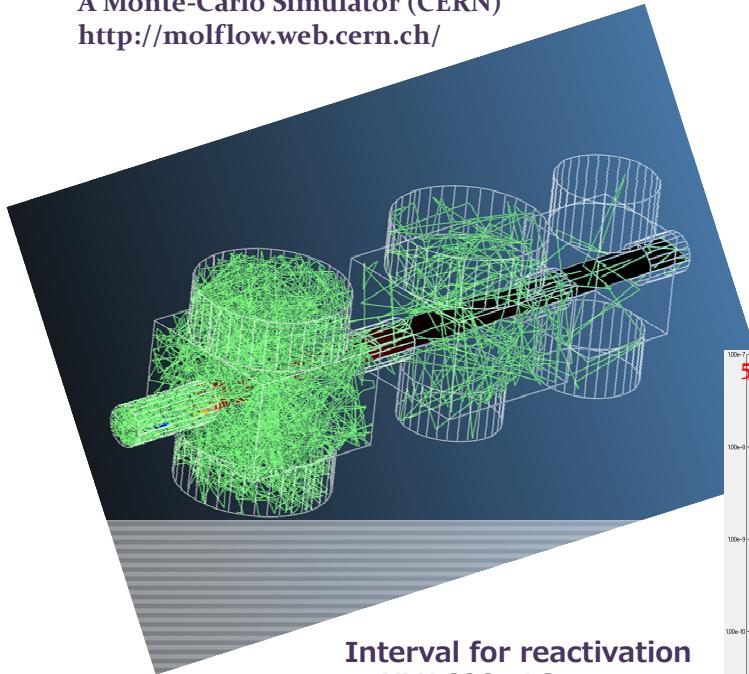

**HV1600 (SAES)**

	Type	Model	Vender	Nominal pumping speed
1st. Stage $5\text{e-}7$ Pa	Turbo Mol. Pump	HiPace700	Pfeiffer	685 L/s (N <sub>2</sub> ) 555 (H <sub>2</sub> )
	Roots Pump	NeoDry30E	Kashiyama	500 L/min (N <sub>2</sub> )
	Cryo Pump	ULVAC-U6H	ULVAC	750 L/s (N <sub>2</sub> ) 1100 (H <sub>2</sub> ) <b>2100 (H<sub>2</sub>O)</b>
2nd. Stage $5\text{e-}8$ Pa	High Vacuum NEG	Capacitorr HV1600	SAES	<b>1700 L/s (H<sub>2</sub>) 470 (N<sub>2</sub>)</b>
	Ion Pump	VIP 200 Ion Pump	Agilent	180 L/s (N <sub>2</sub> ) <b>63 (Ar) ~100 (CH<sub>4</sub>)</b>
3rd. Stage $<1\text{e-}8$ Pa	NEG	Capacitorr Z400	SAES	500 L/s (H <sub>2</sub> ) 125 (N <sub>2</sub> ) <b>210 (CO)</b> 4 pumps will be used

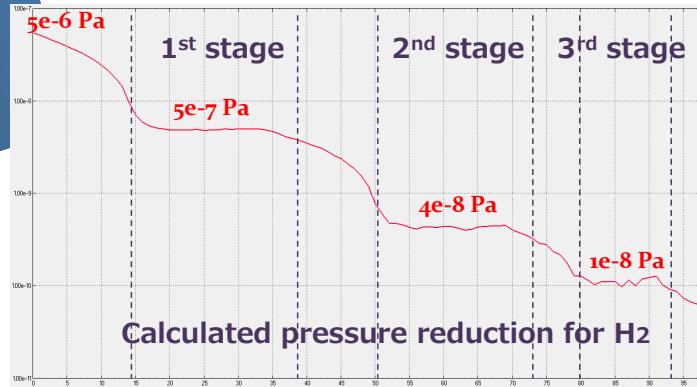

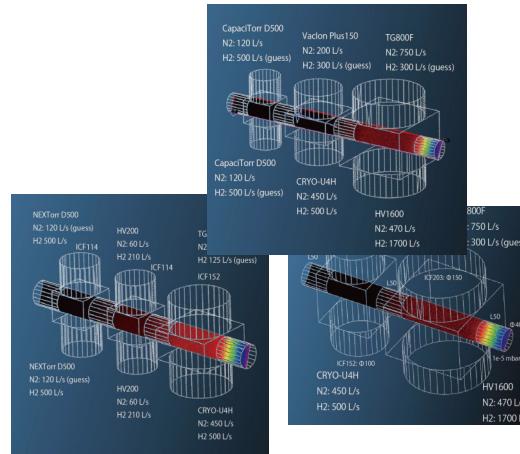

# Design optimization with molflow+

## molflow+

A Monte-Carlo Simulator (CERN)  
<http://molflow.web.cern.ch/>

Interval for reactivation  
HV1600; 16 years  
Z400; 1 year

Chambers are cleaned with pressurized water

Screws, nuts, washers ~2000 pieces

Blown by ion gun continuously for several days after ultrasonic washing

# Assembling in clean room (ISO1)

※ISO class1 particles (>0.1um) less than 10/m<sup>3</sup>

Procedure for cleaning of gate valve)

1. Ultra-pure water pouring
2. Ion gun blow
3. Vacuum baking (12h)
4. Ion gun blow
5. Ion gun blow with closed
6. Ion gun blow open with opened

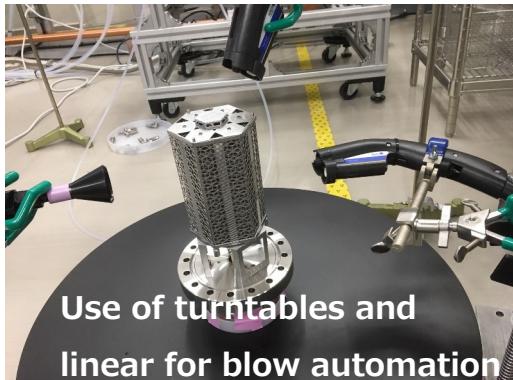

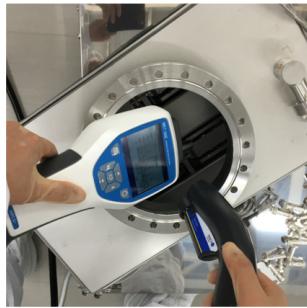

# Assembling in clean room (ISO1)

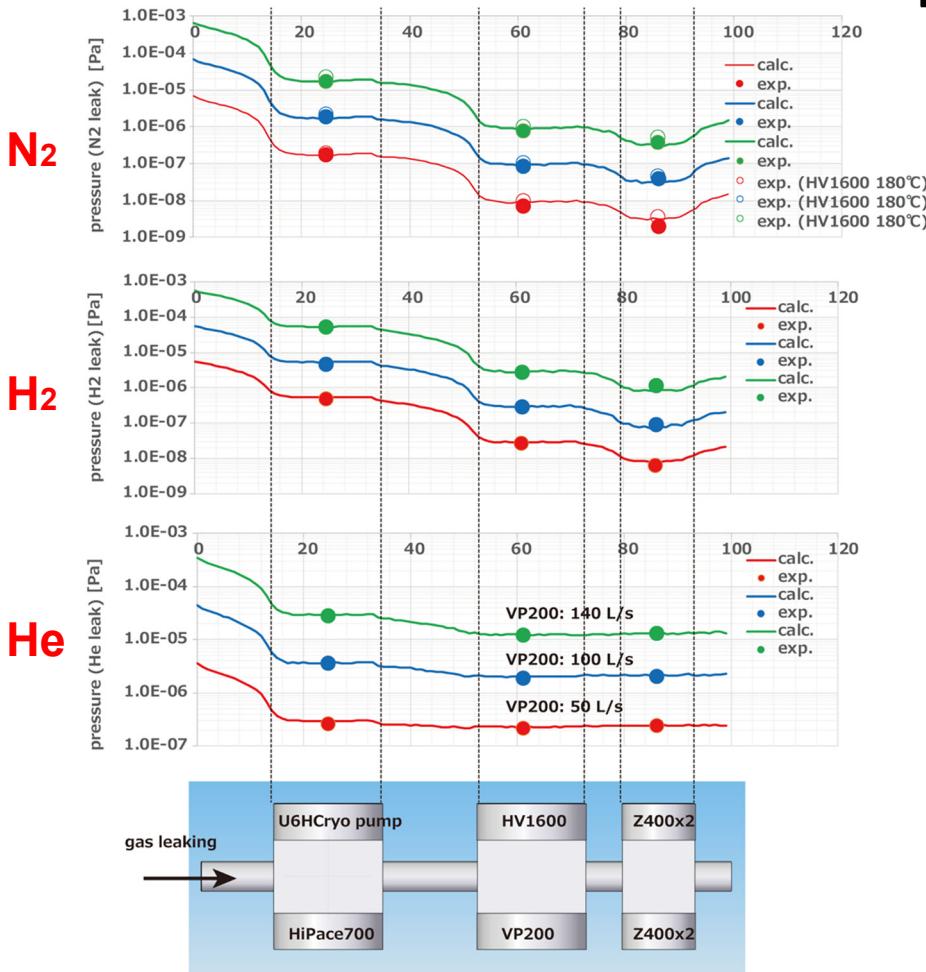

※ISO class1 particles (>0.1um) less than 10/m<sup>3</sup>

Continue to blow inside  
the ion pump for two days

# Results of performance test

Achievable vacuum  $\sim 2 \times 10^{-9}$  Pa

The 3<sup>rd</sup> stage pressures when ambient pressure of  $10^{-5}$ - $10^{-6}$  Pa

N<sub>2</sub>:  $\sim 2 \times 10^{-9}$  Pa

H<sub>2</sub>:  $\sim 6 \times 10^{-9}$  Pa

He:  $\sim 2 \times 10^{-7}$  Pa

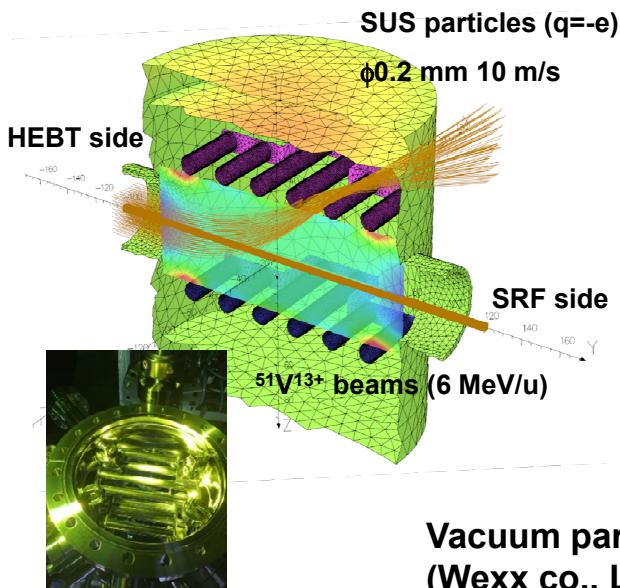

(NEG is almost no pumping power for He)

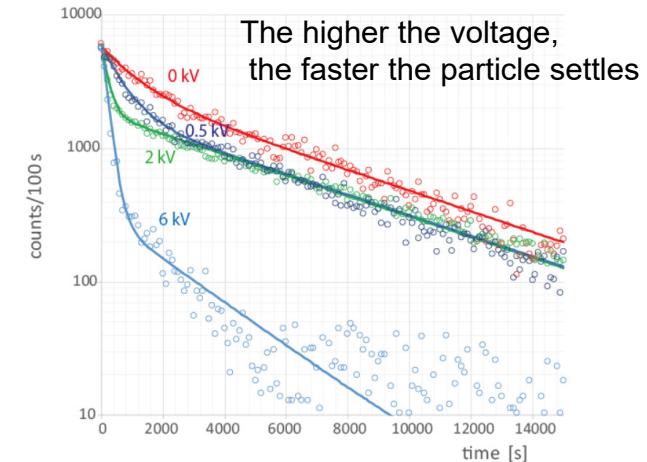

# Original electrostatic particle suppressor (EPS)

The EPS consists of two electrodes, each of them consists of 6 stainless steel bars.

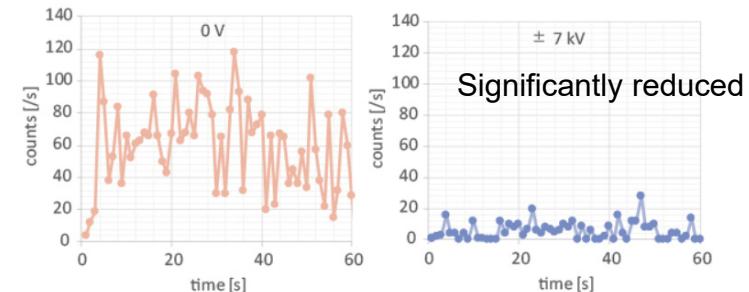

We can apply high voltage up to  $\pm 10$  kV on both electrodes.

The EPS can reduce the particle transport to the SRF

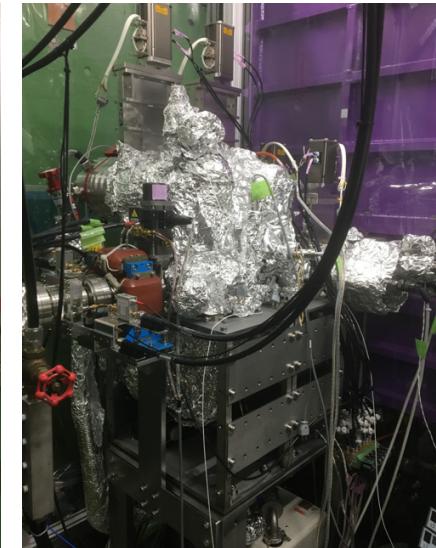

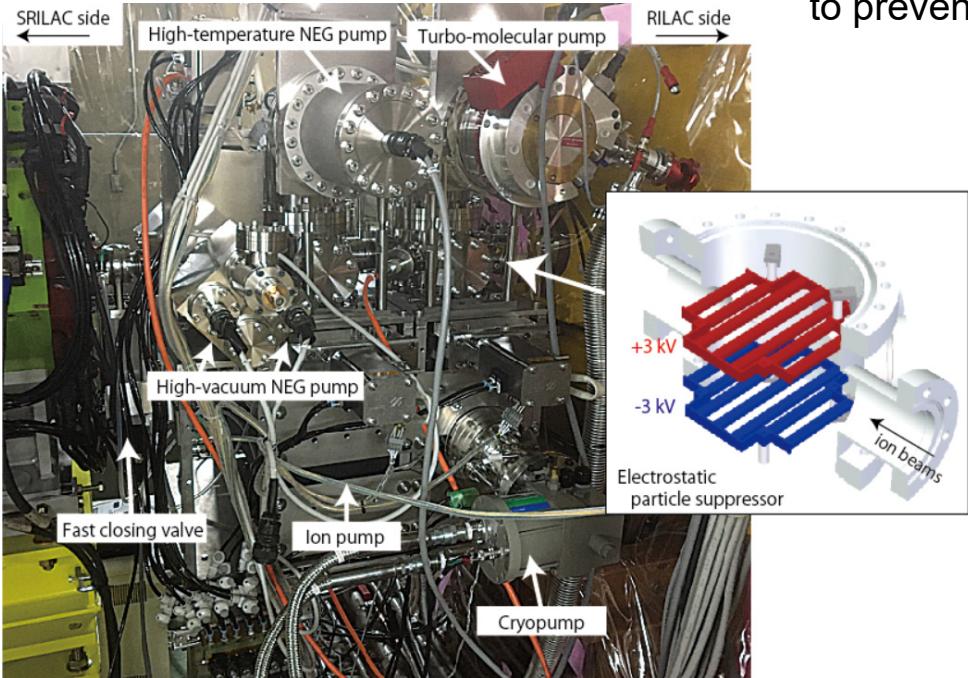

Dependence of particle counts ( $> 0.3 \mu\text{m}$ ) on the voltages after the fast venting

Particle counts ( $> 0.3 \mu\text{m}$ ) when the ceramic block was scraped in vacuum

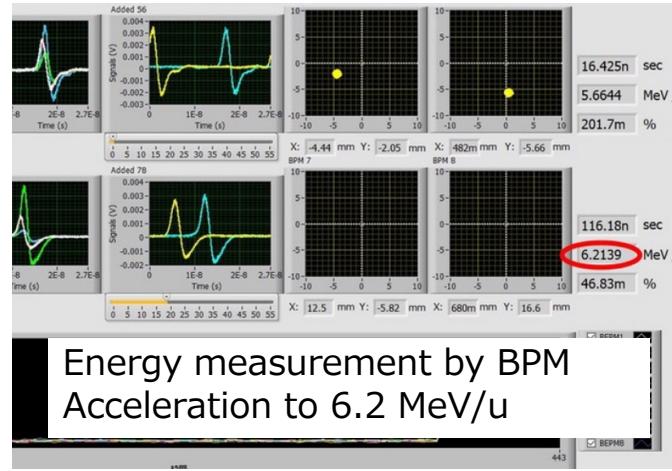

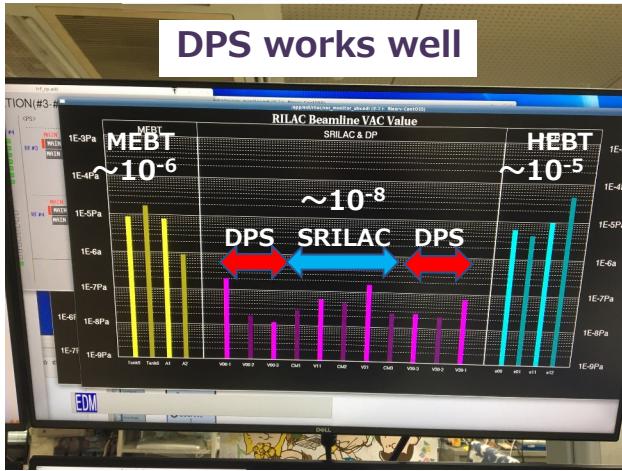

# Installation on site

A simple clean booth was set up on site and connected while internally pressurized with argon gas to prevent particle contamination

# First beam acceleration

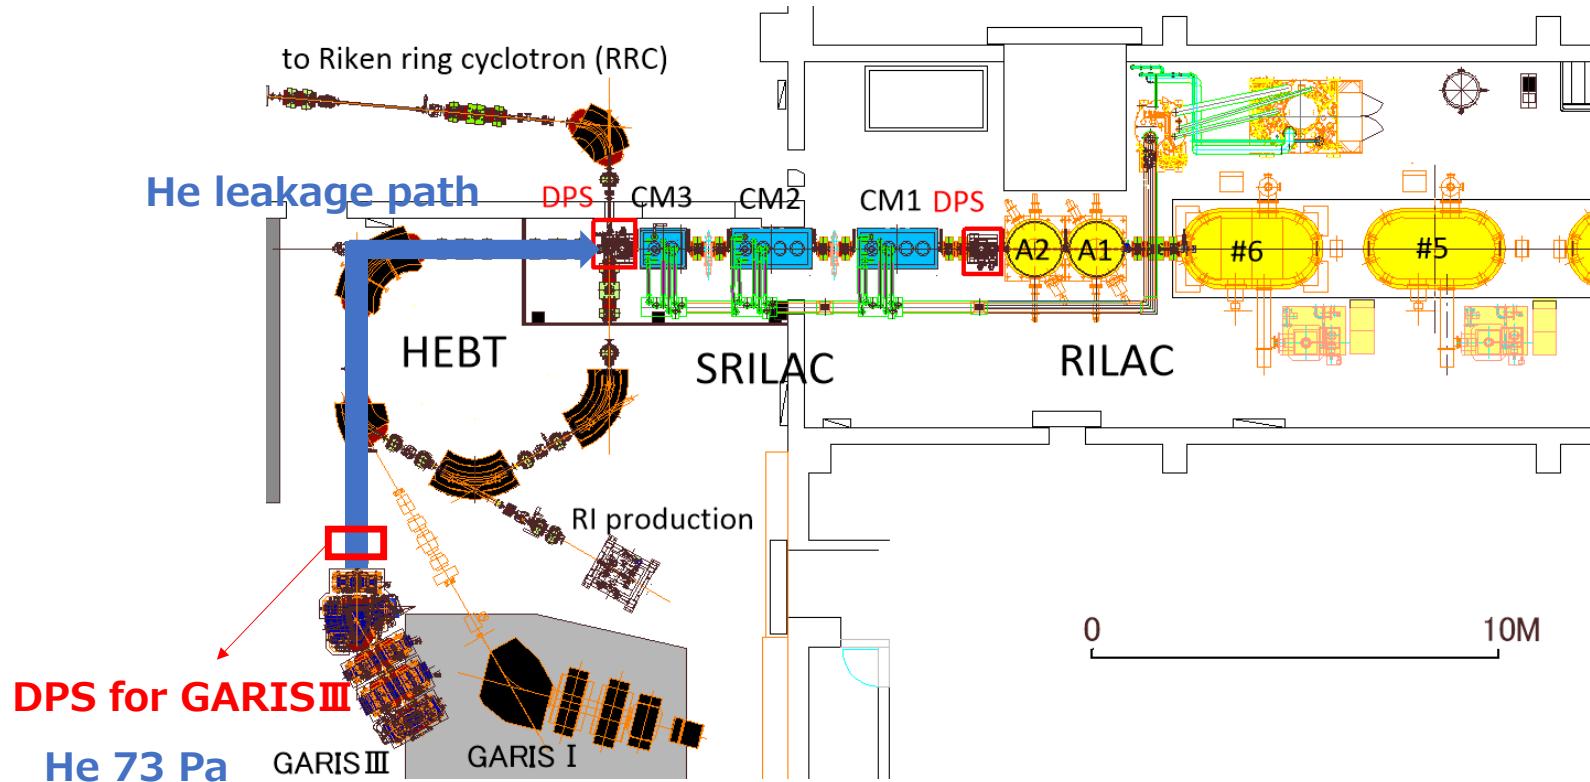

First beam acceleration achieved by the end of January 2020

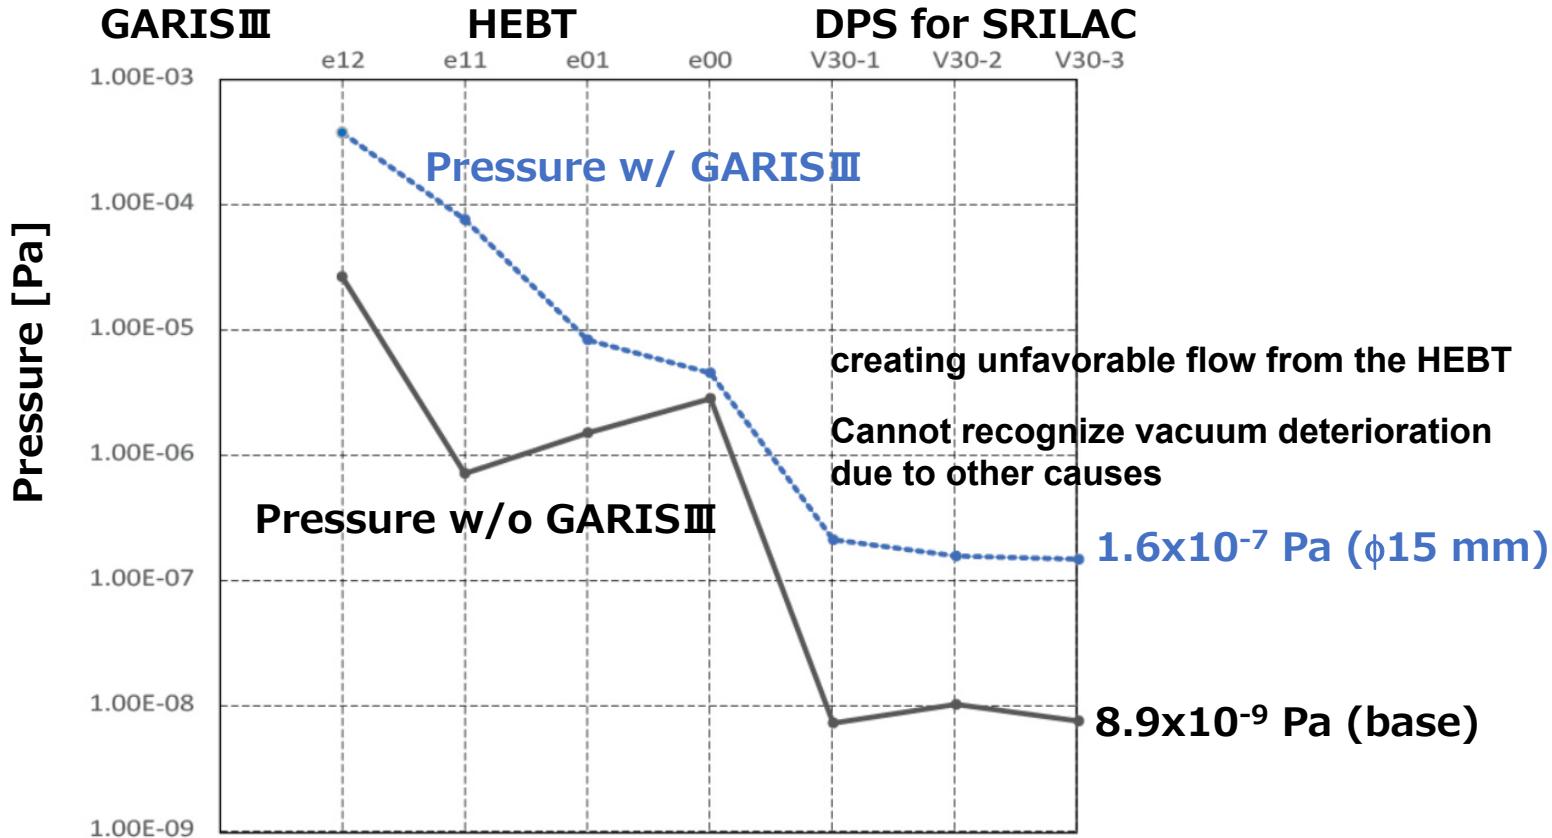

Successful acceleration of Ar13+ to 6.2 MeV/u  
No serious degradation of the SRFs

# He leakage from GARIS<sup>III</sup>

He gas used in the GARIS<sup>III</sup> experiment was leaking through the DPS to the SRILAC

# Vacuum deterioration due to the GARISⅢ

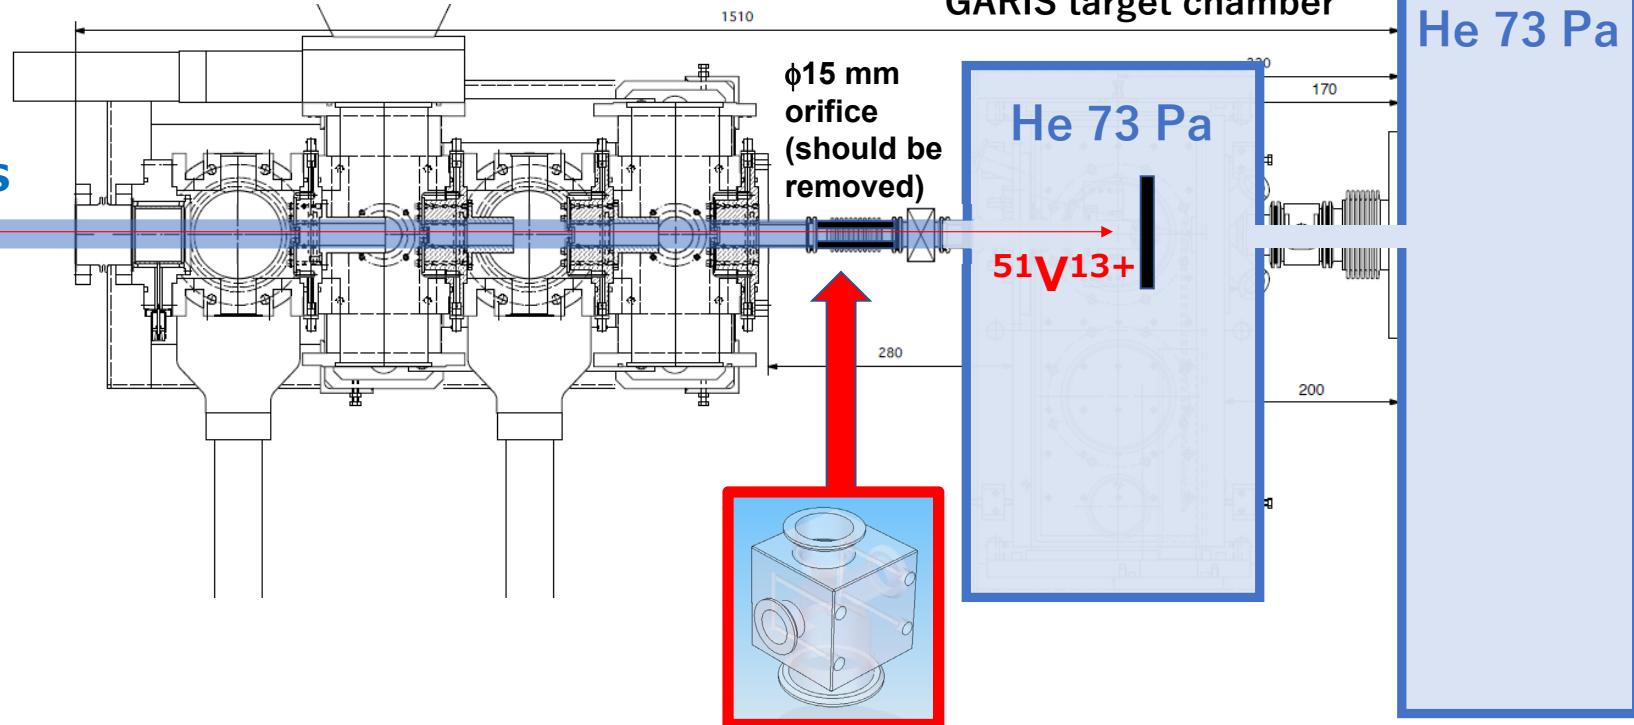

## 4-stage differential pumping system (MBP + 7 TMPs)

Already quite large system

HEBT

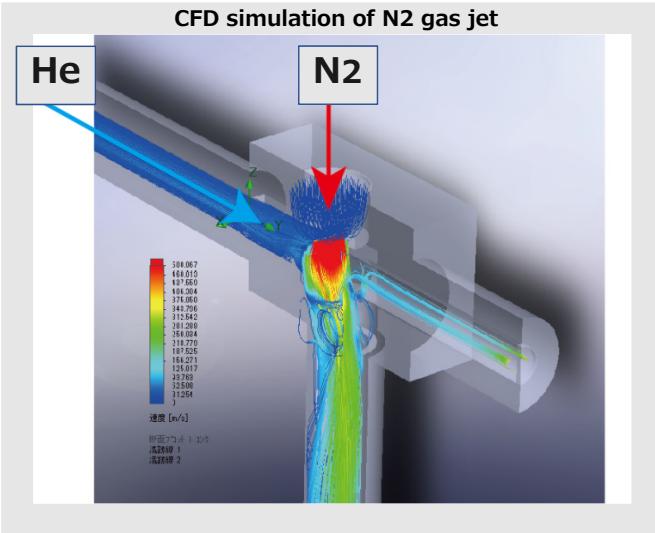

He gas

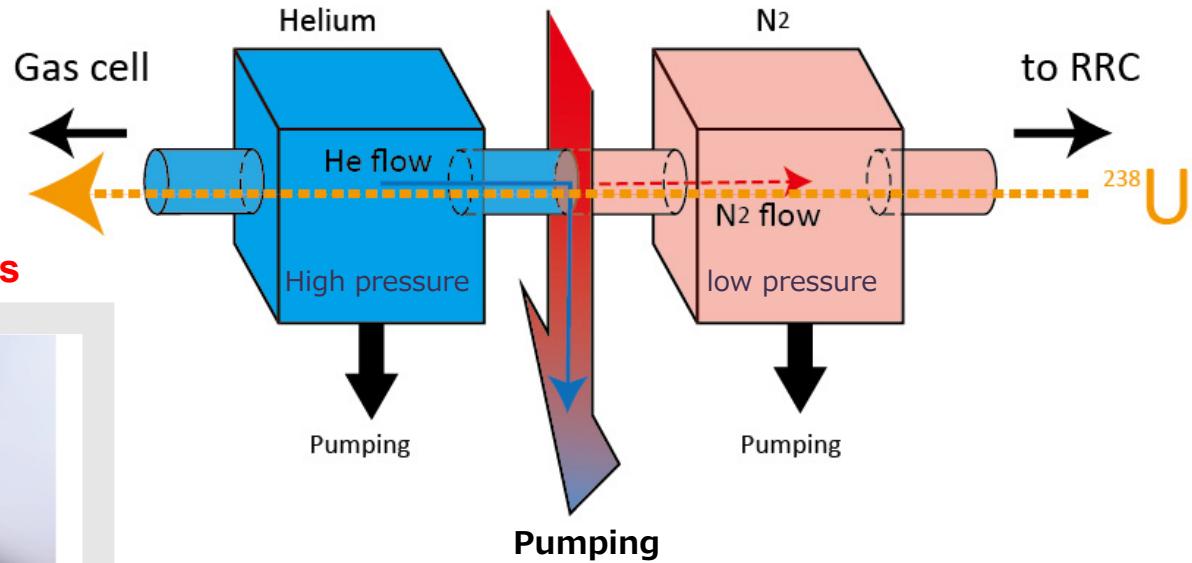

N2 gas-jet curtain ( $\phi 25$  mm)

# Concept of gas jet curtain

First used in He strippers

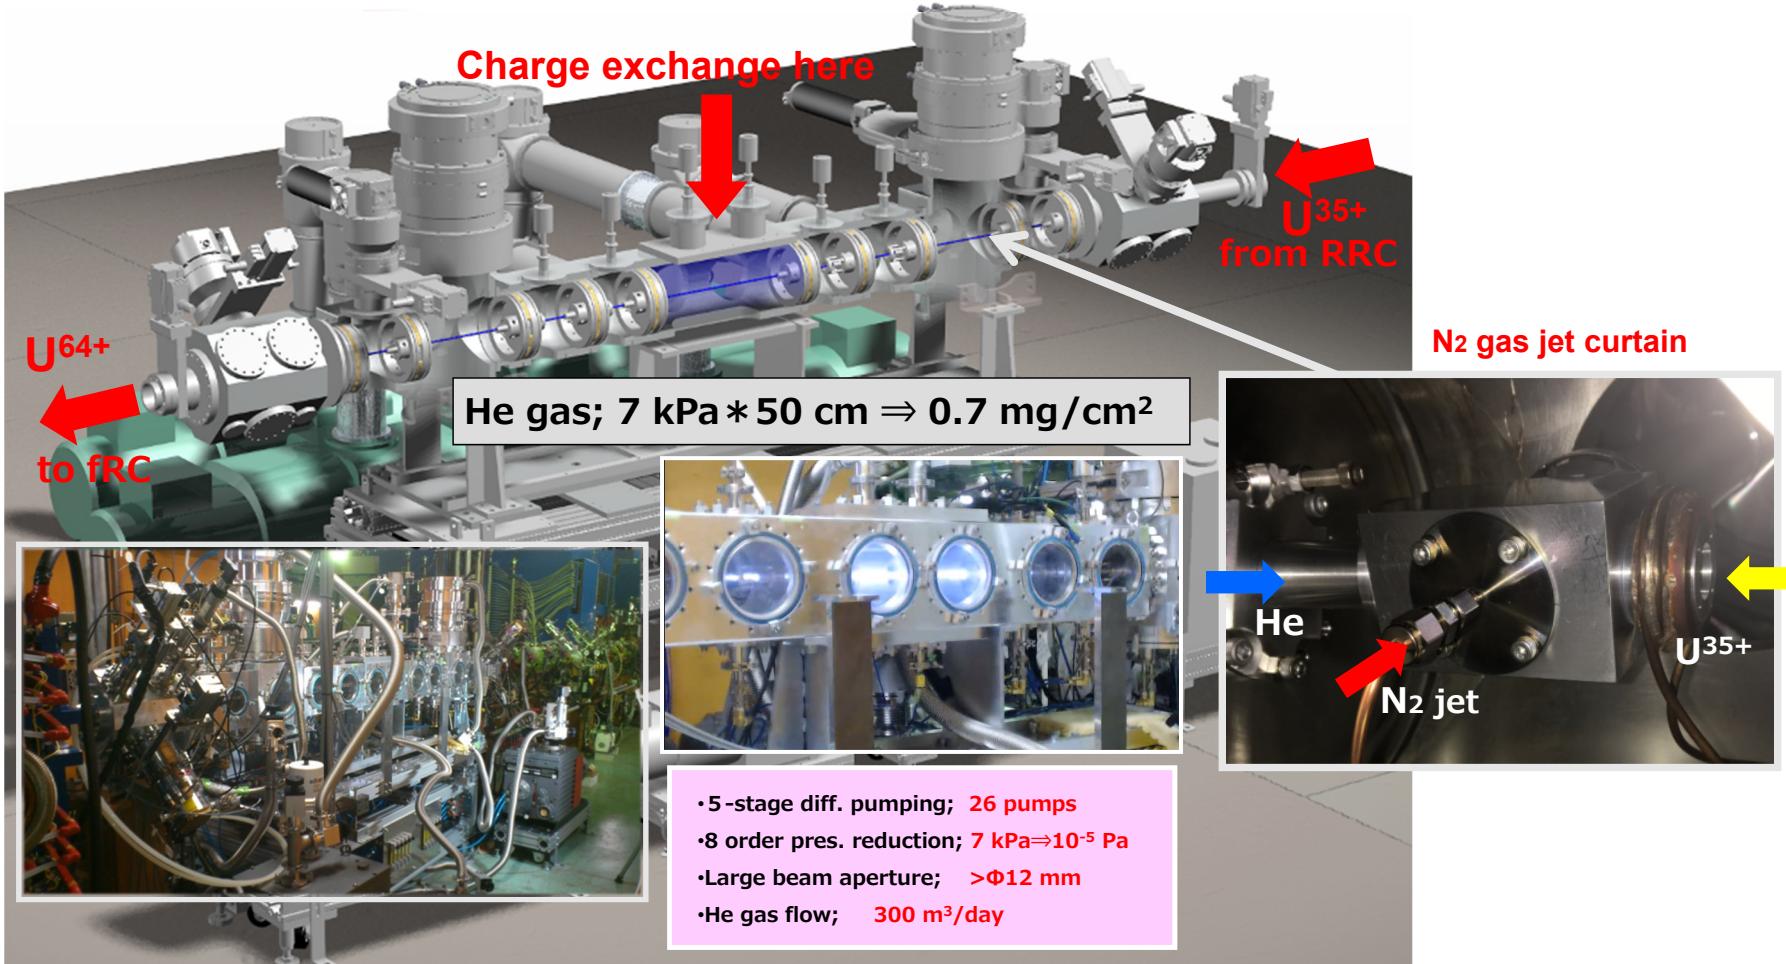

Curtain-like nitrogen-gas jet

Block He flow and exchange leaked gas species

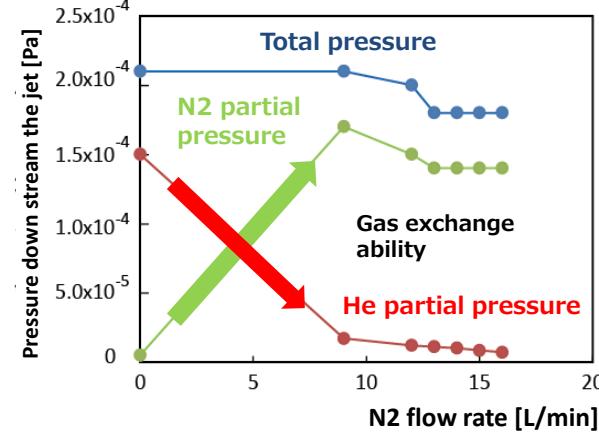

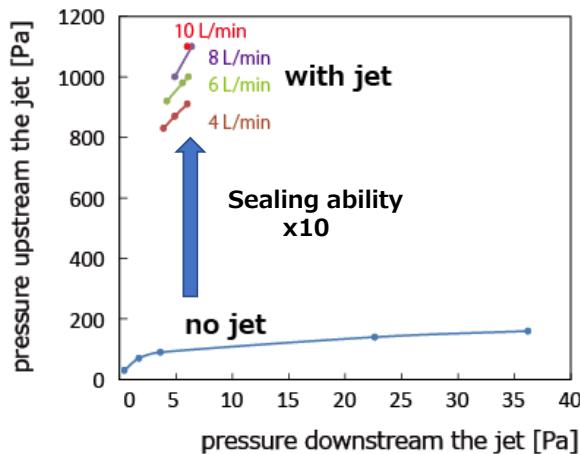

N<sub>2</sub> gas can be easily evacuated by vacuum pumps

# Application in He stripper

# Performance of N<sub>2</sub> gas-jet curtain for He stripper

Performance of N<sub>2</sub> gas-jet curtain for He stripper excellent (patented)

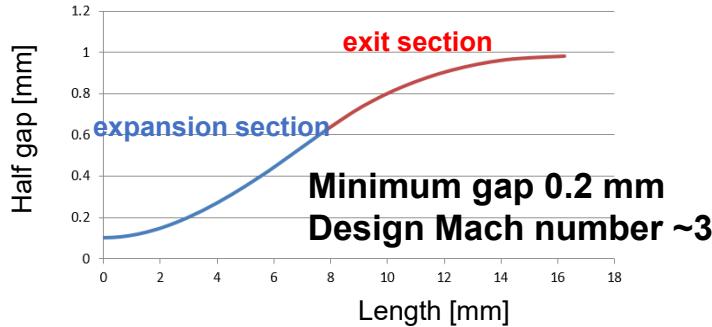

We can accumulate He gas at **10 times** the pressure without changing downstream pressure by using the gas-jet curtain

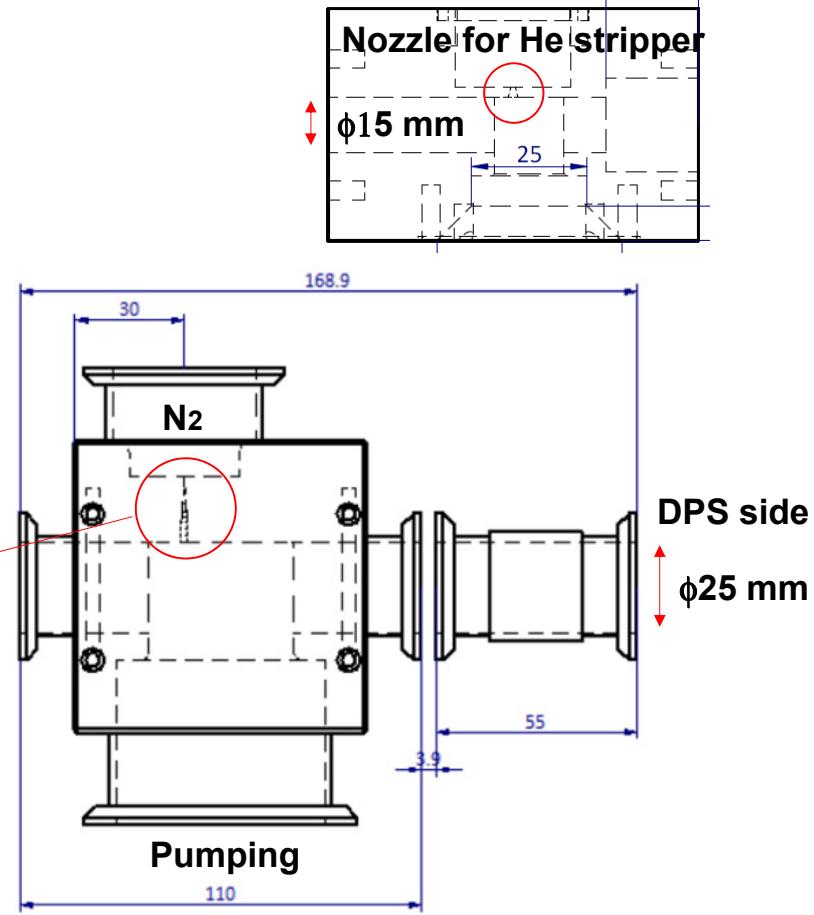

The gas leaked to downstream was successfully **exchanged to N<sub>2</sub>** as we desired

# Nozzle design of gas jet curtains for GARIS<sup>III</sup>

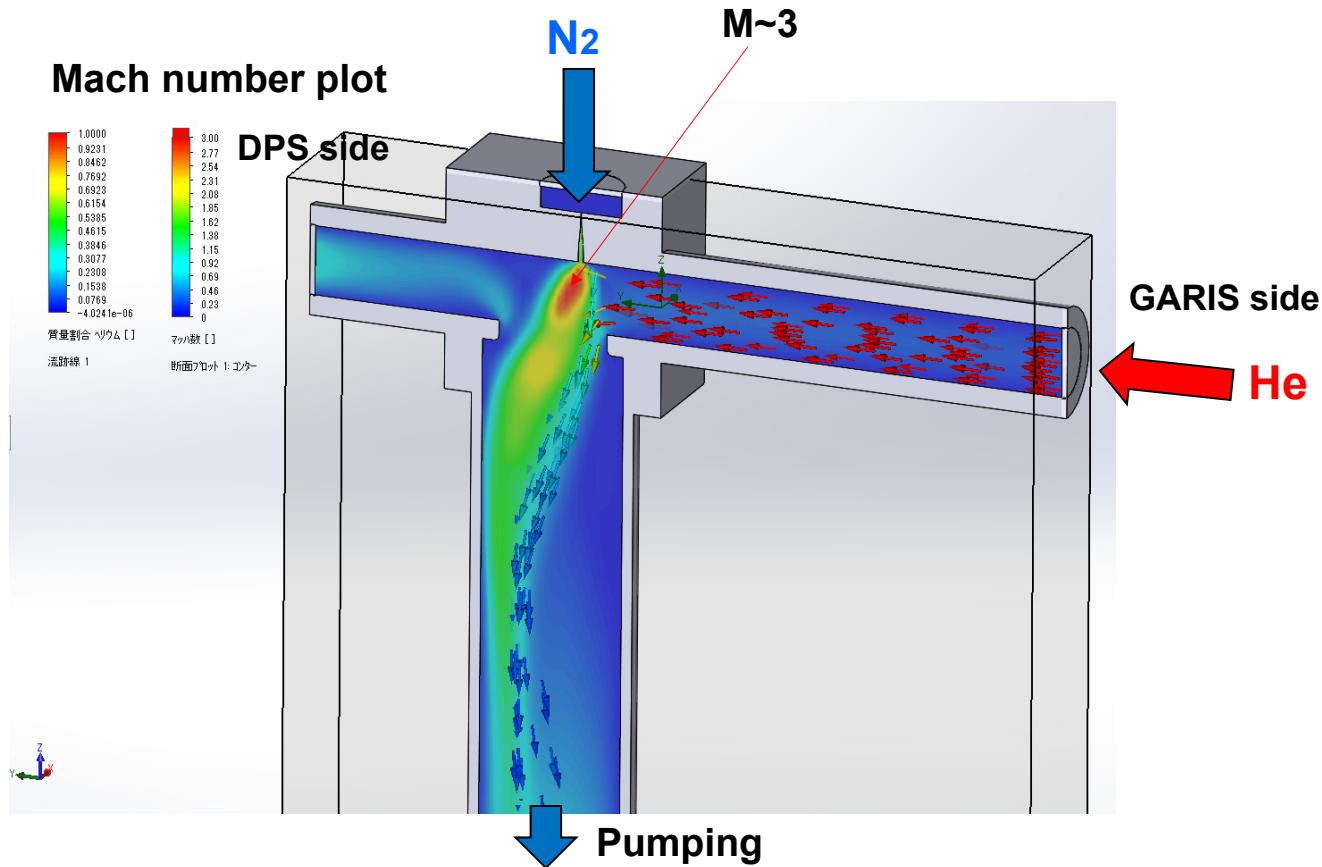

2-D Laval nozzle to increase the jet velocity  
(ref. NASA Technical note 1651)

GARIS side

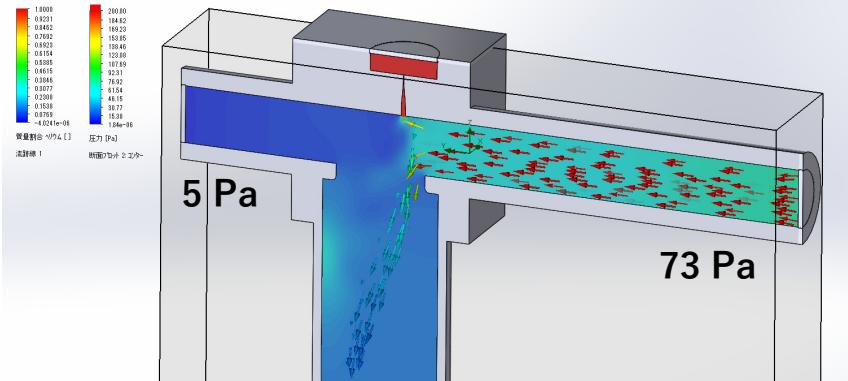

# CFD calculations

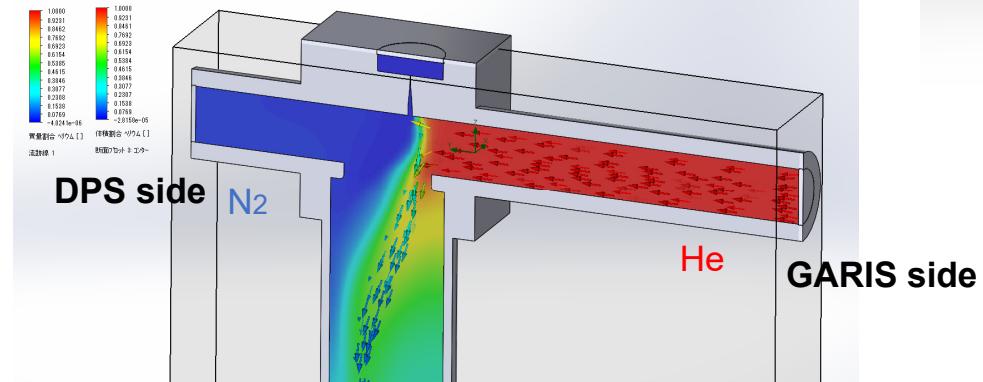

CFD simulation by using **SOLIDWORKS Flow Simulation**

# CFD calculations

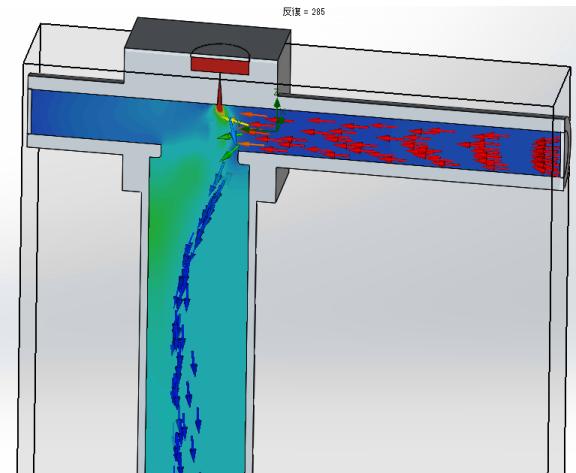

## Pressure

## Ratio of N<sub>2</sub> to He gas

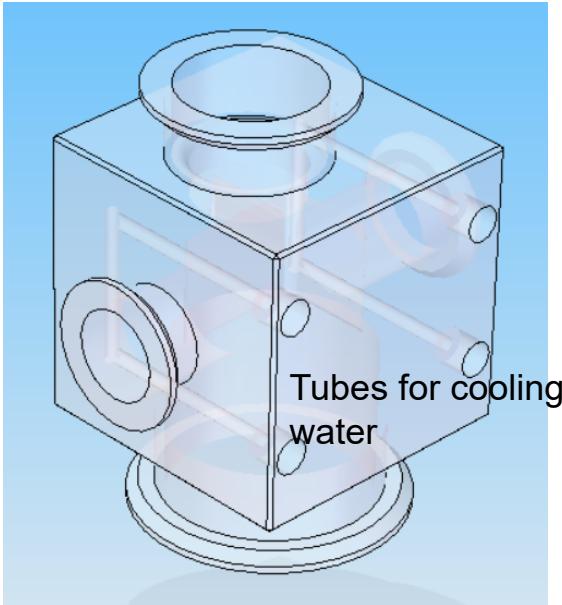

## Density

Gas thickness is  $\sim 1 \mu\text{g}/\text{cm}^2$

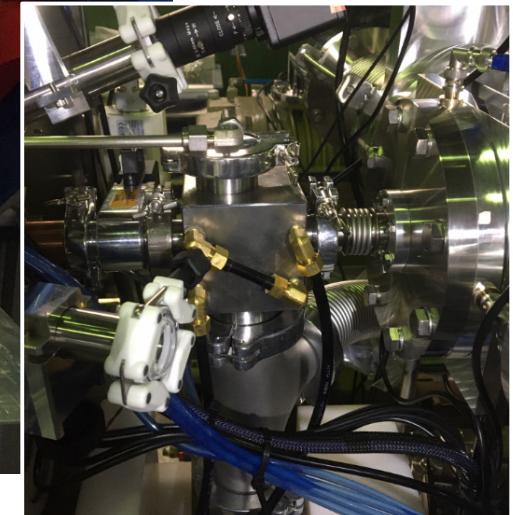

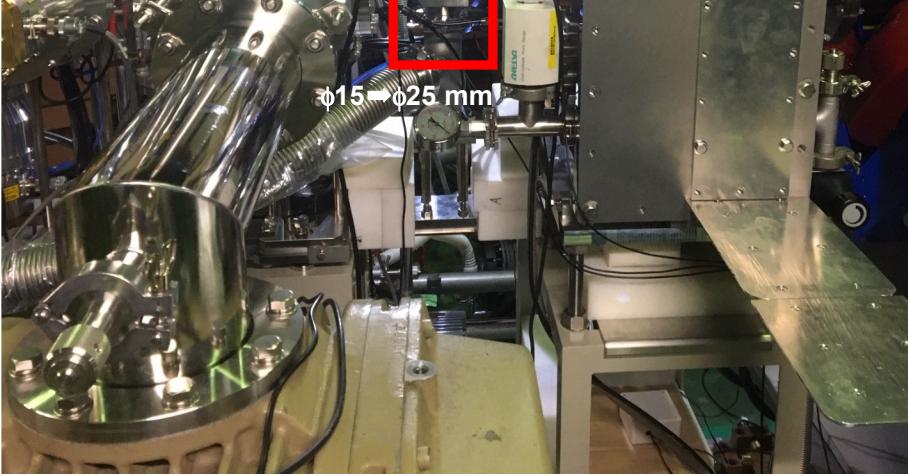

Energy deposition of  $^{51}\text{V}^{13+}$  (6MeV/u) is  $\sim 22 \text{ keV}$   
The effect on the beam is almost negligible

# Production of actual apparatus

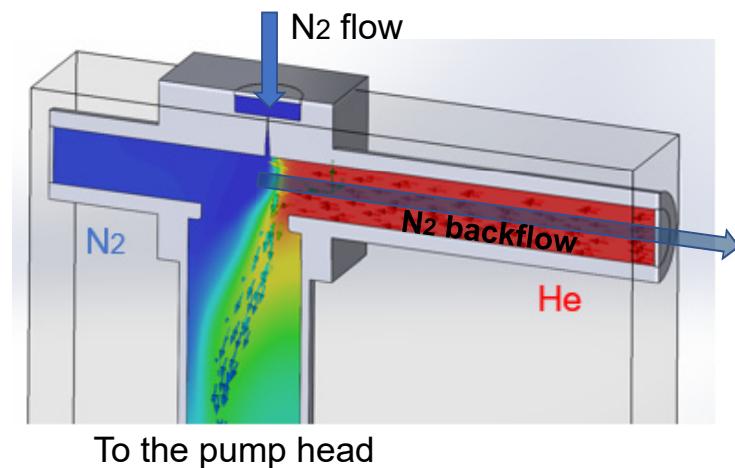

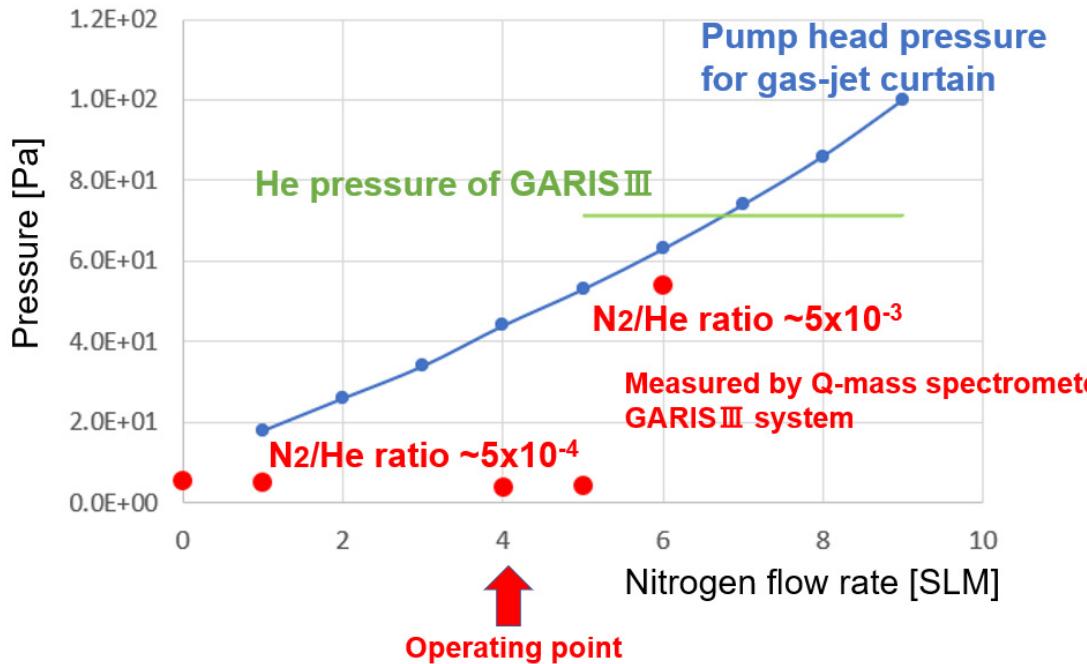

The nozzle has a half-split structure and is fabricated by electrical discharge machining.

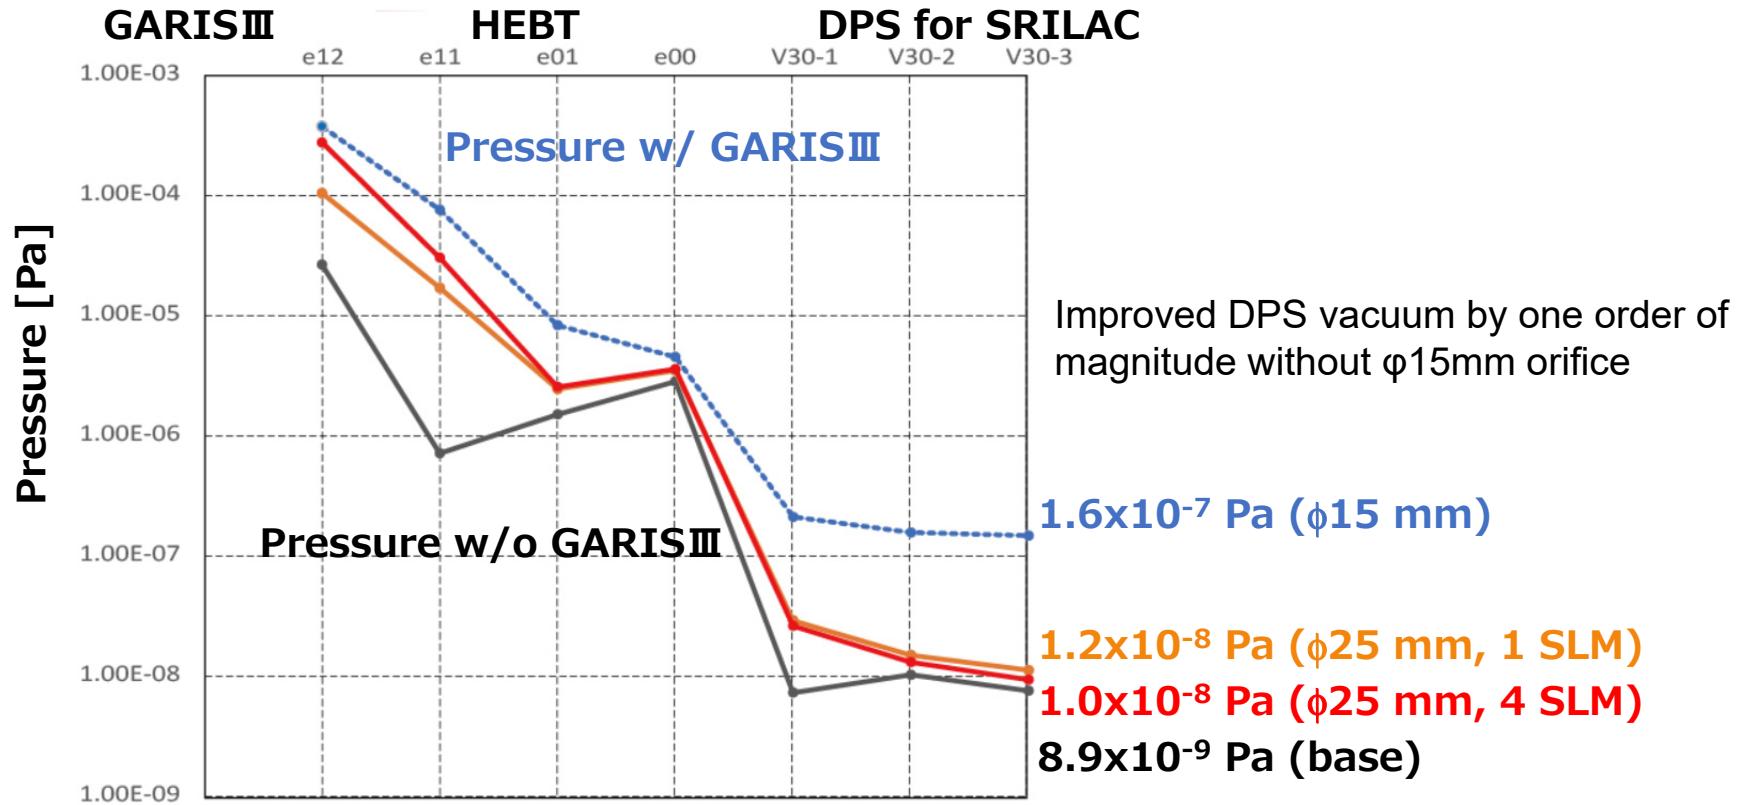

# Installation of gas-jet curtain

# N<sub>2</sub> backflow into GARIS<sup>III</sup>

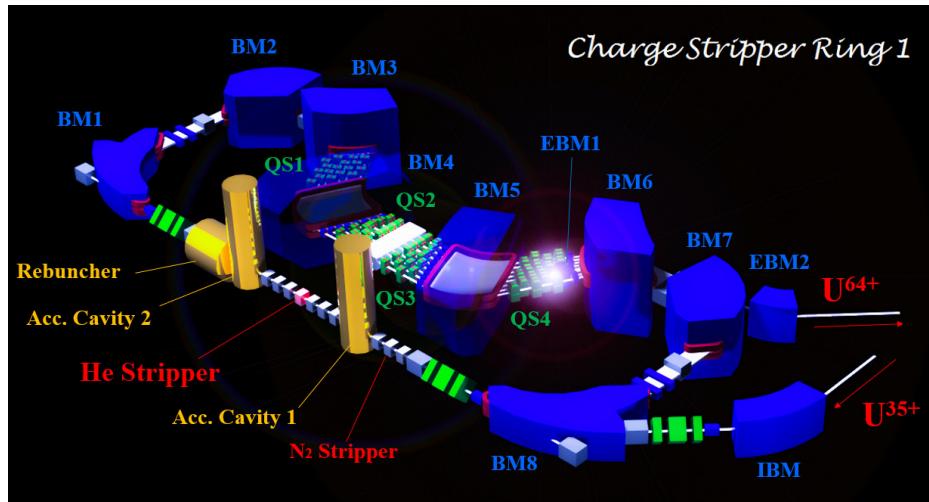

# Performance of gas-jet curtain

The 3rd stage pressure of DPS was drastically reduced when we turned on the gas jet curtain. We also confirmed that there was no effect on the beam when we used gas-jet curtain.

# Summary and future prospects

- **SRILAC** has been operating successfully since 2020.
- Compact and powerful **NEG-based DPSs** were developed.
- **Nitrogen gas-jet curtain** method was applied to solve the problem of He leakage from GARIS III.
- All system has been running without major problems for nearly two years of intermittent operation.
- Future plans for the RIBF include a **charge stripper ring (CSR)**, where the gas-jet curtain method will also be applied.

## charge stripper ring (CSR)

H. Imao, Charge Stripper Ring for RIKEN RI Beam Factory, JINST 15 (2020) P12036.

H. Imao et al., The present status and future plan with charge stripper ring at RIKEN RIBF, IPAC2022, TUIYGD2.
