Status of the Design and test of SC Magnets for the NICA Project

Laboratory of High Energy Physics, Joint Institute for Nuclear Research, Dubna, Russia
Outline

• NICA/MPD project
• Design of the NICA magnets:
  - SC cable
  - booster magnets
  - collider magnets
• First results of the magnets test
• Conclusion
• **NICA/MPD project**
• Design of the NICA magnets:
  - SC cable
  - booster magnets
  - collider magnets
• First results of the magnets test
• New test facility
• Conclusion
• The NICA/MPD project started at JINR in Dubna in 2007.

• The goal of the project is to carry out experimental studies of the hot and dense strongly interacting quantum chromodynamics matter and light polarized ions.

• The NICA/MPD complex will consist of two injectors, a new SC booster synchrotron, the existing SC synchrotron – Nuclotron, and the new SC collider with two detectors.

The prototype dipole magnet with bent single-layer winding was built in April 2011. A full-scale model quadrupole magnet for the NICA booster was manufactured at the LHEP in December 2011.

The NICA booster magnets: Installation of the cryostat with the dipole magnet on the bench for the cryogenic test (left) and quadrupole lens before mounting in the cryostat (right).
Design of the NICA collider magnets

The Nuclotron-type design was chosen for the NICA collider. Two identical single-layer windings are located in the common straight iron yoke one over the other. Lorentz forces in the windings are supported by the yoke.

Cross-section view of the dipole magnet for the NICA collider.

1 – iron yoke,
2 - SC coil,
3 – cooling tube,
4 – beam pipe,
5 - bus – bars.
The yoke consists of three parts made of laminated electrical steel. They are held together by longitudinal steel plates welded with laminations and frontal sheets. The magnets are cooled with a two-phase helium flow.

4 – bus - bars.
Design of the final focus lens should be completed in late 2012. Production of the first model lens is scheduled for the second half of 2013.

Field gradient $G = 19 \text{ T/m}$. Operating current $I = 10.3 \text{ kA}$. Number of turns per pole – 6. Pole radius $R = 90 \text{ mm}$.

Design of the NICA collider magnets

A twin aperture model dipole magnet for the NICA collider was manufactured at LHEP JINR in August 2011. Manufacturing of the model collider twin-bore quadrupole lens with hyperbolic poles was completed in September this year.

The first NICA collider twin-bore dipole magnet in own cryostat (left) and iron yoke of the quadrupole lens (right).
• NICA/MPD project
• Design of the NICA magnets:
  - SC cable
  - booster magnets
  - collider magnets
• First results of the magnets test
• New test facility
• Conclusion
A cryogenic test of the first dipole magnet for the NICA booster synchrotron was carried out in May 2011. The first quench occurred at 7705 A. After the 13\textsuperscript{th} quench the current reaches the nominal value of 9690 A. This corresponds to the magnetic field induction in the gap of 1.8 T. Further training was stopped because of the power supply limitation.
The measured static heat flow to the magnet was 5.8 W. AC losses of 12 W were measured by means of the calorimetric method while the magnet was operating in the triangular cycle with a magnetic field ramp rate of 1.2 T/s without a pause. This value agrees well with the calculation and confirms the correct choice of steel for the magnet yoke.
The pressure drop of the helium flow in the cooling channel of the magnet was 47 kPa during the operation in the indicated mode. Hydraulic resistance of the cooling channel was 2 times higher than the calculated value due to the fact that the cooling channel of the cable has a diameter of 2.6 mm instead of the designed one equal to 3 mm.

The new coil of the cable with a cooling channel of 3 mm in diameter was fabricated and installed in the yoke of the magnet. Cryogenic tests of the magnet with the new winding was carried out in May 2012. Training for new winding consisted of a single quench at 9475 A. The maximum current in the magnet of 11 299 A was determined by quench in the current lead. Measurement of the harmonics of the magnetic field in the aperture of dipole magnet has been done with the help of equipment that was used for the Nuclotron magnets. Sextupole harmonic of the field in the Booster magnet was about 10 times less than in the Nuclotron magnet. The higher harmonics of the field with the specified equipment is not observed.
Experimental studies of the Booster quadrupole magnet were carried out in spring 2012 after upgrading the power supply on the test bench.

The current reached the nominal value of 9690 A after the 4th quench.

The measured static heat flow to the quadrupole magnet was 3.3 W.

AC losses of 4.4 W were measured by using the calorimetric method while the magnet was operating in the triangular cycle with the following parameters: amplitude of the magnetic field gradient of 20.3 T/m, and ramp rate of 20.3 T/(m·s) without a pause.

The pressure drop of the two-phase helium flow in the cooling channel of the lens was 7 kPa during the operation in the indicated mode.
First results of the magnets test. *Quadrupole magnet for the NICA booster*

AC losses as a function of the magnetic field gradient ramp rate in the aperture for the NICA quadrupole magnet.

Hamlet Khodzhibagiyan, RuPAC 2012, September 27, Saint-Petersburg
Outline

• NICA/MPD project
• Design of the NICA magnets:
  - SC cable
  - booster magnets
  - collider magnets
• First results of the magnets test
• New test facility
• Conclusion
• Premises with an area of over 2,600 m$^2$ prepared for installation of equipment.

• Supply of HTSC current leads and power supply of 15 kA are scheduled for early October 2012 and Spring 2013, correspondingly.
• Contracts for the cryogenic and vacuum equipment for the new test bench, there are 6 terminals for parallel testing of the SC magnets, are in preparation.

• Commissioning of the first stage of the new stand is scheduled for 2013.
• NICA/MPD project
• Design of the NICA magnets:
  - SC cable
  - booster magnets
  - collider magnets
• First results of the magnets test
• New test facility
• **Conclusion**
• The full-scale Nuclotron–type superconducting model dipole and quadrupole magnets for the NICA booster and collider were manufactured at LHEP JINR.
• First dipole and quadrupole magnets for the NICA booster have successfully passed the cryogenic test on the bench.
• The nominal current of 9.7 kA was reached after short training.
• The magnets were successfully tested in the pulsed mode with a magnetic field ramp rate of up to 4 T/s.
• The measured values of AC losses and the pressure drop of the helium flow in the cooling channel agrees well with the calculation.
• Tests of the model magnet and lens for the collider are scheduled for autumn of this year.
• New facility for testing the SC magnets is under installation of technological equipment.
