

SRF Linac for LCLS-II: Design Approaches, R&D, and First Test Results

Marc Ross (SLAC LCLS-II)

SRF2015 Whistler, BC

14 September 2015

Introduction

For your consideration:

Three elements for technical advancement:

1. Science →

Motivation

2. Technical development →

Tools that enable

3. Industrial and Infrastructure backbone →

Practical Capability and Cost

1. Introduction
2. Free Electron Laser based on SRF
3. Linac requirements
4. CW Linac based on TESLA/ILC/E-XFEL Technology
5. R&D
6. Initial Results
7. Production Plan
8. Summary

Linac Coherent Light Source Facility

First Light April 2009

Injector at
2-km point

Existing Linac (1 km)
(with modifications)

New e^- Transfer Line (340 m)

Undulator (130 m)

X-ray Transport
Line (200 m)

Near Experiment Hall

Far Experiment Hall

2009: Success of LCLS at SLAC

→ Remarkable facility for remarkable photon science ←

What's next for photon science in the US? How to develop this valuable tool?

Extraordinary convergence (2010 – 2013):

1) LCLS Success

2) Technical Development and Industrialization of a core linac technology →

Superconducting Radio-Frequency (SCRF)

Old / new technique to be deployed together for LCLS-II

LCLS-II Hybrid Free Electron Laser at SLAC:

DOE Partner Labs bring the expertise

SLAC

- 50% of cryomodules: 1.3 GHz
- Cryomodules: 3.9 GHz
- Cryomodule engineering/design
- Helium distribution
- Processing for high Q (FNAL-invented gas doping)

Design Lead

- 50% of cryomodules: 1.3 GHz
- Cryoplane selection/design
- Processing for high Q

- Undulators
- e^- gun & associated injector systems

- Undulator Vacuum Chamber
- Also supports FNAL w/ SCRF cleaning facility
- Undulator R&D: vertical polarization

- R&D planning, prototype support
- processing for high-Q (high Q gas doping)
- e^- gun option

Largest deployment of this technology to date

- 100 cryomodules
- 800 cavities
- 17.5 GeV (pulsed)

SLAC
FNAL/ANL
Cornell
JLab

US infrastructure for

- 35 cryomodules
- 280 cavities
- 4 GeV (CW)

LAL/
Saclay
DESY
INFN Milan

Kitakami
proposed ILC site

IHEP
KEK

International Partner Labs lend their expertise

1. Introduction
2. Free Electron Laser based on SRF
3. Linac requirements
4. CW Linac based on TESLA/ILC/E-XFEL Technology
5. R&D
6. Initial Results
7. Production Plan
8. Summary

LCLS-II SRF Linac

Closely based on the **European XFEL / ILC / TESLA** Design

- Under development ~ 20 years with **> 1000 cavities** by 2016

Uses **CEBAF-12 GeV Upgrade Cryoplant** Design

LCLS-II Linac consists of:

Component	Count	Parameters
Linac	4 cold - segments	35 each 8 cavity Cryomodules (1.3 GHz) 2 each 8 cavity Cryomodules (3.9 GHz)
1.3 GHz Cryomodule	8 cavities/CM	13 m long. Cavities + SC Magnet package + BPM
1.3 GHz 9-cell cavity	280 each	16 MV/m; Q ₀ ~ 2.7e10 (avg); 2 deg. K; bulk niobium sheet - metal
Cavity Auxiliary	per each cavity	Coaxial Input Coupler; 2 each HOM extraction coupler; lever-type tuner
Cryoplant	2 each	4.5 K / 2.0 K cold box system; 18 kW @ 4.5 K equivalent (x two)

1.3 GHz cavity Q0			2.70E10
E [MV/m]			16.0
Linac heat-loads (kW)	HTTS (80K)	LTTI (8K)	2.0 K
Cryomodule static	4.05	0.82	0.28
Cryomodule dynamic	5.28	0.63	3.01
Distribution system	3.28	0.19	0.15
Estimated TOTAL	12.61	1.64	3.44

2 Kelvin Heat Load – Dynamic vs Static

Comparison:
Dynamic vs
Static 2 K Heat
load

Existing SLAC Linac in its Tunnel (~1966 to present day)

Linac

Support Structure

Tunnel Layout and Cross-section

1.3 GHz Modules (Fermilab/JLab)

First 800 m of SLAC linac (1964):

35 +2 cryomodules to replace
~500 m of S-band linac

Cryogenic Plant Building Site

Cryogenic System Schematic

1. Introduction
2. Free Electron Laser based on SRF
3. Linac requirements
4. CW Linac based on TESLA/ILC/E-XFEL Technology
5. R&D
6. Initial Results
7. Production Plan
8. Summary

CW Linac based on TESLA/ILC/E-XFEL

Design Approach and R&D Plan

- Proof of principle
 - Low cryogenic-loss performance – *Vertical Test*
 - Magnetic shielding
 - Cool-down protocol
- Design validation
 - Cryogenic performance – *Horizontal Test*
 - High average power Coupler
 - High-performance tuner
 - Conduction-cooled quadrupole
 - Solid-state high-power single-cavity RF source
 - Radiation
- Integration

A standard 1.3 GHz 9-cell cavity:

LCLS-II CW operation: 16 MV/m; $\langle Q_0 \rangle \sim 2.7 \times 10^{10} \rightarrow 10 \text{ watts@2.0 K}$

- $\langle E_{acc_max} \rangle$ 18 MV/m
- 280 each
- 16 from ILC-GDE SRF (2009-2011); $\leftarrow$ Provided by Fermilab (short)
- 264 dressed cavities to be made by industry following XFEL-style production scheme

SRF Cavity Gradient Progress

L-Band SRF Niobium Cavity Gradient Envelope and Gradient R&D Impact to SRF Linacs

Steady progress in SRF cavity gradient makes SRF an enabling technology
SRF based electron linacs (CW & pulsed) have track record of successful operations

Cavity dressed in its titanium helium vessel with power coupler

- 27 LHe liters @ 2.0K/0.029 bar
10x greater heat load than XFEL/ILC
95 mm 'chimney'
 - ~centrally located
 - SS-Ti Ex-bonded joint
- Two fill lines

Cavity / helium vessel suspended from low-pressure cold-gas return pipe

Cryomodule backbone: 300 mm diameter pipe

- Scissor tuner compatible with short inter-cavity spacing

1. Introduction
2. Free Electron Laser based on SRF
3. Linac requirements
4. CW Linac based on TESLA/ILC/E-XFEL Technology
5. R&D
6. Initial Results
7. Production Plan
8. Summary

Motivation for High Q_0 R&D

High Q_0 doping developed by Fermilab

“The best cavities of 2010”

The SRF world is changing

“The best dressed cavity of 2014”
(so far)
TB9AES011

FNAL IB4 Vacuum Oven: High Q Nb surface doping done here

Achieved Q_0 at Maximum Eacc by 9-Cell 1300 MHz TTF-style Nb Cavities

C. Reece

New performance domain

The door has opened
to new
opportunities.

New interesting
challenges have
appeared for
exploiting these
opportunities with
high Q_0 .

Three-lab High Q0 Studies schedule (2014):

1. Use single-cell cavities to optimize and define protocol
2. Apply to nine-cell cavities for vertical test
3. and for horizontal (cryomodule-like) cryostat test

What Has Been Learned toward High Q_0 ?

C. Reece

- Subtle near-surface **material details** matter a lot
 - High temperature diffusion doping can lower R_{residual} **and** $R_{\text{“BCS”}}$
 - The best surfaces show **decreasing** R_s to **~5 nohms** @80 mT, 2 K, 1.3 GHz
- **Magnetic flux** must be carefully managed
 - Cavity Q performance is easily limited by extrinsic effects that yield frozen-in flux that
- **“Magnetic hygiene”** standards must improve or be actively corrected
 - Fixture hardware, instrumentation connectors, etc. non-magnetic, low permeability
- **Temperature gradient** across cavity during T_c transition is very helpful for expelling residual flux. (“Fast” is but a means of creating gradient.)
- **Asymmetric temperature gradient** across cavity assembly with dissimilar metals during T_c transition may generate currents, large B -field, and frozen flux.
- **Cavity quench** presents opportunity for flux entry – and Q degradation
- N-doped material appears to **trap available flux more readily** than non-doped material.
- Higher doping appears correlated with **lower cavity quench fields**.

What Has Been Learned toward High Q_0 ?

- Temperature gradient across cavity during T_c transition is very helpful for expelling residual flux. (“Fast” is a means) **FNAL VTS tests**

N-doped bare 9-cell

Slow cooling leads to strong deterioration of Q_0

Meissner effect flux expulsion is sensitive to the cooling conditions through T_c

Trapped flux adds R_s

Detailed characterization is underway

A. Romanenko et al. J. Appl. Phys. 115, 184903 (2014)

LCLS-II Linac System Design:

1. High average power input coupler; high heat in a cryomodule
2. High Q loaded ($4e7$); sensitive to tuning and microphonics (few 10's Hz)
3. Conduction-Cooled Magnet Package
4. RF Power source; cost and flexibility
5. Radiation from 'dark-current' self-captured electrons

Power Coupler Design and Integration

Thermal interfaces to cryomodule

3. Conduction-Cooled Magnet Package
4. RF Power source; cost and flexibility
5. Radiation from 'dark-current' self-captured electrons

LCLS II Tuner – parameters and accessibility

Electromechanical actuator & piezo can to be replaced through special port

Tuner parameters	specifications	measured
Coarse Tuner ration	20	21.5
Coarse Tuner frequency max. range	450kHz	>600kHz
Coarse Tuner resolution	1-2 Hz/step	1.3Hz/step
Coarse Tuner short range hysteresis	50Hz	45Hz
Piezo Tuner range(for 4 piezo & 120V)	1kHz	3kHz
Piezo Tuner Resolution	1Hz	0.1Hz

Fast/piezo Tuner Design – Cross Section:

Encapsulated piezo designed and manufactured by Physik Instrumente (PI) per FNAL specifications.

Preloaded Piezo actuator consisting of (2) butted PICMA™ low-voltage multilayer piezo ceramics stacks (18*10*10mm). Piezo preloaded with 800N. Each tuner equipped with 4 piezo-stacks, each piezo can be run independently

LCLS-II Linac System Design:

1. High average power input coupler; high heat in a cryomodule
2. High Q loaded ($4e7$); sensitive to tuning and microphonics (few 10's Hz)
3. Conduction-Cooled Magnet Package
4. RF Power source; cost and flexibility
5. Radiation from 'dark-current' self-captured electrons

Split Quad Conduction Cooling Test at STC

- 3D Model of Quadrupole and Leads Configuration
 - in Spoke Test Cryostat (STC) at Meson Detector Bldg (MDB)

Summary – Conduction Cooled Magnet Package

- The conduction cooled magnet and current leads showed the stable performance at 20 A peak specified current for all coils.
- The current ramp rate study confirmed that the magnet could be excited with the ramp rate up to 1 A/s without quench.

7. Production Plan
8. Summary

Cryomodule Production

- Follow as closely as possible XFEL industrialized path
 - Saclay (CEA) now assembling one cryomodule every four days
 - **Both Fermilab and Jlab will have Saclay – style production line**
 - **Substantially lower rate**
 - Guidance for touch-labor (cost) estimate
- Production-line development between three labs (and DESY)
 - (work-station development, tooling, touch-labor analysis collaborative effort)
- Desy, Saclay, and Orsay (LAL) are special partners to LCLS-II

LCLS-II Schedule

LCLS-II Strategy – One Design, Two Production Lines operating in parallel

- Designs for Prototype and Production CMs (aim to satisfy PR and CM FRS)
- **Identical Prototypes** - utilize as much existing hardware as possible to reduce schedule risk and reduce overall cost while achieving the same performance as the production CMs
- **Identical Production Designs** - utilize as much of the DESY/XFEL design as practically possible to reduce schedule risk and reduce overall cost
 - **FNAL produces 16 CMs; JLab produces 17 CMs**
- **Identical Parts Received** at Partner Labs
 - Well-developed drawing packages, clear requirements and specifications
 - Concurrent reviews within LCLS-II project
 - Procurement activities – lead technical contacts at Jlab/FNAL/SLAC work together during all phases
- **Identical Tooling Interfaces**
 - Interfaces between CM hardware and tooling are identical
 - Avoid adding custom features to CM
 - Adapt non-CM hardware interfaces to Lab-specific tooling
- **Equivalent Processes yielding Equivalent Performance**
 - Recognize that some tools are different at each lab (e.g. HPR, vertical testing systems, vacuum leak checking equipment, etc.)
 - Monitor key process variables in consistent fashion (e.g. samples to verify etch rates)

Fermilab SRF Overview

25 years experience with
ILC / TESLA design

- FNAL has been building SRF Program since 2006
 - Extensive infrastructure – can be used for LCLS II
 - Inspection, EP, tumbling, HPR, VTS, HTS, assembly, CMTS...
 - Ongoing SRF Program supports facility maintenance
 - Cavity & cryomodule design and fabrication (low β and 1.3 GHz)
 - Originally focused on ILC (XFEL CM design, starting point for LCLS II)
 - Now focused on CW applications (PIP II) => complements LCLS II
 - Material & Cavity Processing R&D – now pursuing High Q_0 R&D
- Built three cryomodules of “LCLS II type” (pulsed operation)
 - CM1 successfully tested
 - CM2 currently being tested (most cavities reached 31.5 MV/m)
 - 3.9 GHz (successfully being operated in FLASH)
 - PIP II designs build off this experience

Jlab SRF Overview

~1990, Jefferson Lab (Jlab) SRF Division was created to build the CEBAF accelerator

- **43 cw cryomodules** housing 346 1500 MHz cavities
- 42 standard 8 cavity cryomodules and 1 unique 2 cavity injector cryomodule
- Peak production rate of **2 cryomodules per month**
- Cryomodules/cavities exceeded specifications (~ factor of 2 in gradient and Q_0)

~1995, Jlab FEL

- **4 cw high current** cryomodules, (3 ea 8 cavity and 1 ea 2 cavity)
- Based on the CEBAF design
- New HOM Damping and thermal management
- Higher power RF power couplers, 8 and 50 kW (final 100 kW)

25 years experience
81 Cryomodules

~2000, Spallation Neutron Source (ORNL)

- **24 ea** 3 or 4 cavity cryomodules, 23 production and 1 prototype cryomodule
- Pulsed high power proton machine
- 2 blank sheet cavity and cryomodule designs, medium and high beta
- 18 months from start to first prototype cryomodule tested

~2010, Jlab 12 GeV energy upgrade, C100 cryomodule

- Blank sheet design
- 1500 MHz, 7 cell, Low Loss type (operating at ~20 MV/m) cavities
- Same footprint of old cryomodules resulting in a 40% increase in active length fraction
- **10 ea cryomodules built (80 cavities)**, tested and installed in CEBAF → similarities w E-XFEL

LCLS-II Cryomodule - Front

**Tom Peterson and
Cryomodule Design Team**

LCLS-II Cryomodule - Back

1. Introduction
2. Free Electron Laser based on SRF
3. Linac requirements
4. CW Linac based on TESLA/ILC/E-XFEL Technology
5. R&D
6. Initial Results
7. Production Plan
8. Summary

SRF: ILC ↔ LCLS-II ↔ ILC

Before: TESLA Collaboration, XFEL, SRF R&D

2013: ILC TDR International Review (Feb)

Performance Demonstrations, Industrialization, Cost

2013: LCLS-II CW SRF Linac proposed to DoE – SC(BES)

CD-0 (Aug), CD-1 (Aug 2014), CD-2/3 (2QFY16)

2014: High Q0 Process development

Fermilab (lead), JLab, Cornell; (Cavities from FNAL)

2018: LCLS-II Cryomodule Construction Complete (Aug)

→ First light at end of FY2019

2018: US Infrastructure Qualified and Demonstrated

→ ready for ILC or future SRF application

SRF Cost Reduction / Risk Reduction through application

SCRF Procurement/Manufacturing Model

SRF Summary

Cavity / Cryomodule:

- Cost Validation : **few percent scale**
- Cost Reduction
 - Applied production v/v continued R&D
 - From C100 to EXFEL: **factor 2 cavity cost reduction**
- Technical Risk Mitigation
 - **Demonstrate construction and performance** of TESLA/ILC-type cryomodules for science in the US

For US, the work on LCLS II has brought together SRF programs in a way that maximizes collaboration, efficient sharing of IP, and facilities giving the most “bang for the buck”.
