

Automation of FRIB SRF Cavities and SC Solenoids Turn-on/off

Wei Chang

SRF 2023, Grand Rapids, June 30, 2023

MICHIGAN STATE
UNIVERSITY

This material is based upon work supported by the U.S. Department of Energy, Office of Science, Office of Nuclear Physics and used resources of the Facility for Rare Isotope Beams (FRIB), which is a DOE Office of Science User Facility, under Award Number DE-SC0000661.

Outline

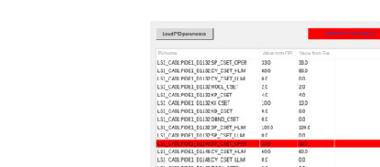

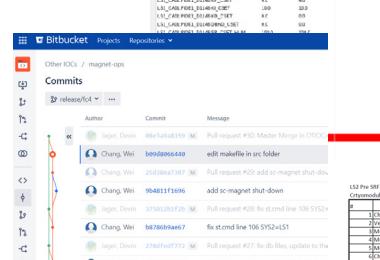

- Introduction
- Cryomodule commissioning experiences convert to automation
- Automation implementation
 - For SRF cavities
 - For superconducting (SC) solenoid packages
 - Emergency shut-down
- Summary

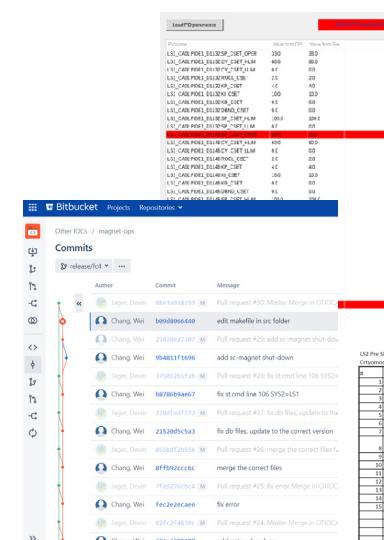

Introduction

- FRIB Linac contains 324 SRF cavities and 69 SC solenoid packages in 46 cryomodules accelerating different heavy ions to 200 MeV/u
 - LS1 & FS1: 104 QWRs with stepper motor tuner operated at 4 K
 - LS2, FS2 & LS3: 220 HWRs with pneumatic tuner operated at 2 K
 - Two beam delivery system send beam to target hall or FRIB Single Event Effects (FSEE) experimental station
- Challenge of this large scale complex system operation
 - Different start-up configurations for different beam types
 - High availability requires fast start-up, recovery from trip and shut-down

Cryomodule Commissioning Experience Convert to Automation

- Details manual procedures for commissioning
 - Sequences checklist for SRF cavity and Solenoid start-up and shut-down
 - Device stability status check methods for start-up
 - Recovery from trip operating steps
 - Tracking parameters changes on commissioning tasks
 - Calibration parameters
 - Control parameters
 - Automation procedure iteration based on test feed back
 - Find out the optimized method from different procedures
 - Failure turn-on cases tracking, troubleshooting, improving and test

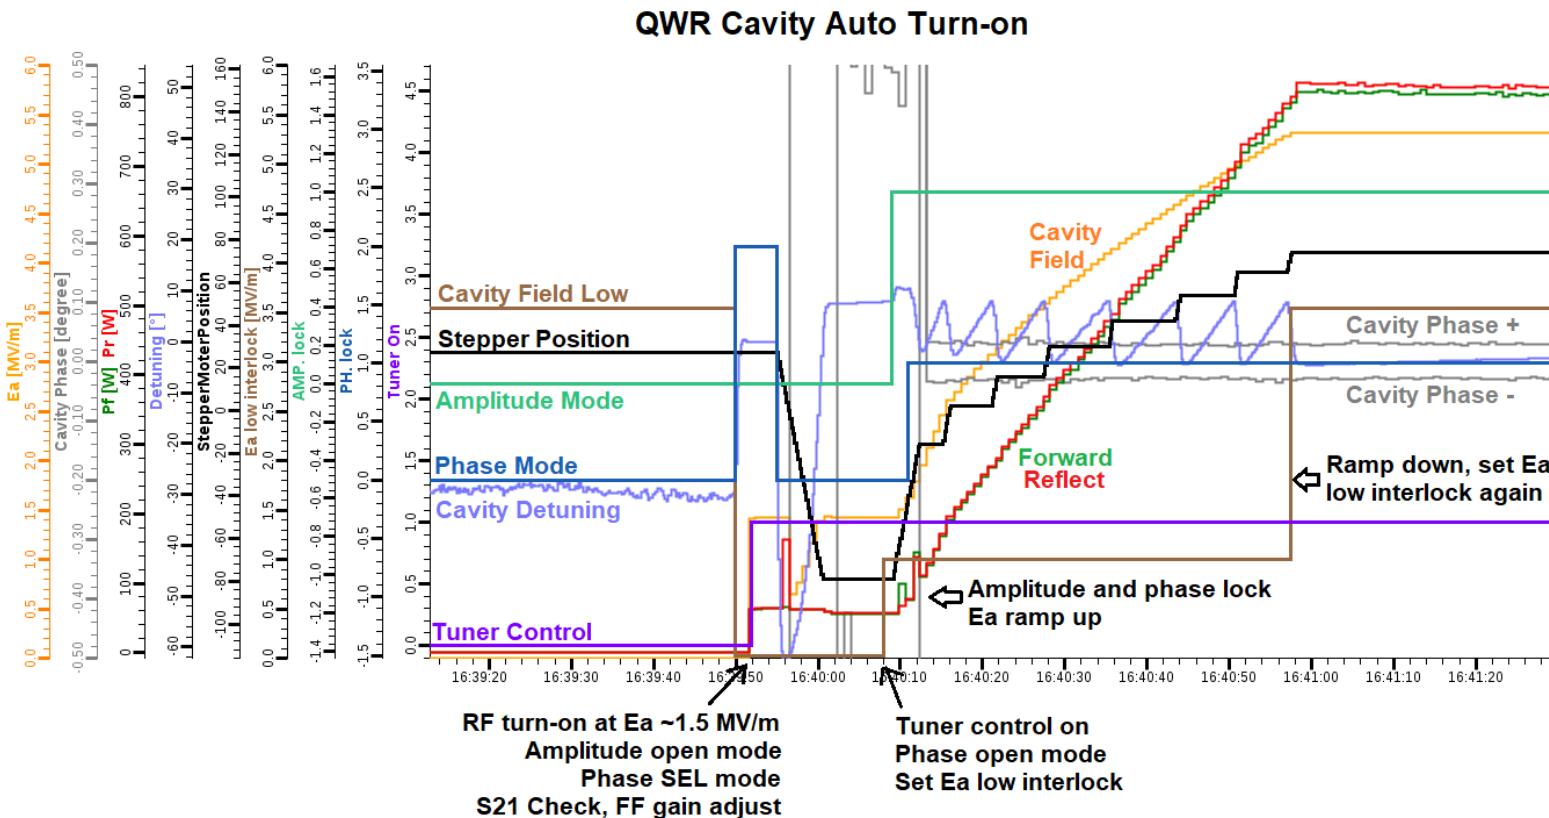

Facility for Rare Isotope Beams

U.S. Department of Energy Office of Science
Michigan State University

QWR Auto Turn-on

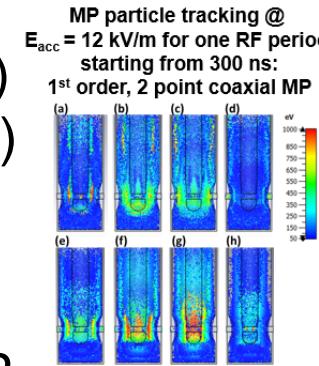

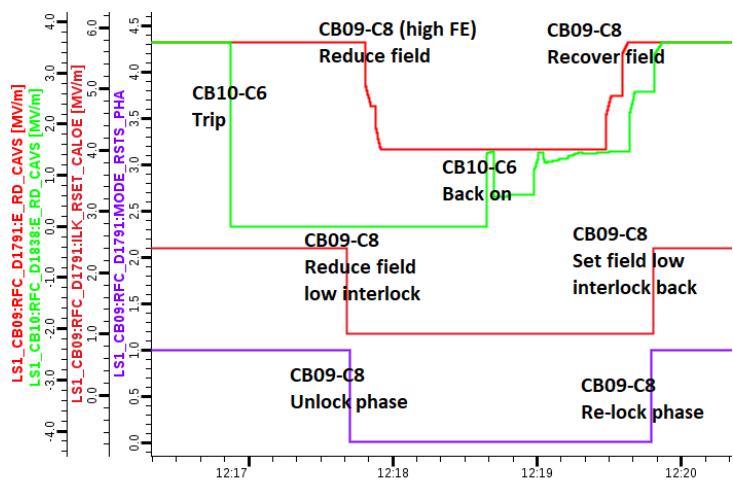

- Start with SEL mode then run stepper tuner to tune cavity frequency
- Check S21 and adjust FF gain, close amplitude and phase loop, ramp-up cavity field to set-point

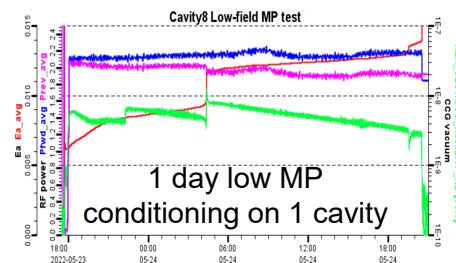

LS1 QWR Fast Recover From Trip

Auto Procedure Help Low Multipacting Barrier Jump Through

- QWR low multipacting (MP) at low field
 - Requires a long conditioning time (> 1 day)
 - MP enhancement due to field emission (FE) from neighboring cavities (cavity recover from trip will stuck into low MP)
 - Reduce neighboring high FE cavity field to help tripped cavity jump through the low MP

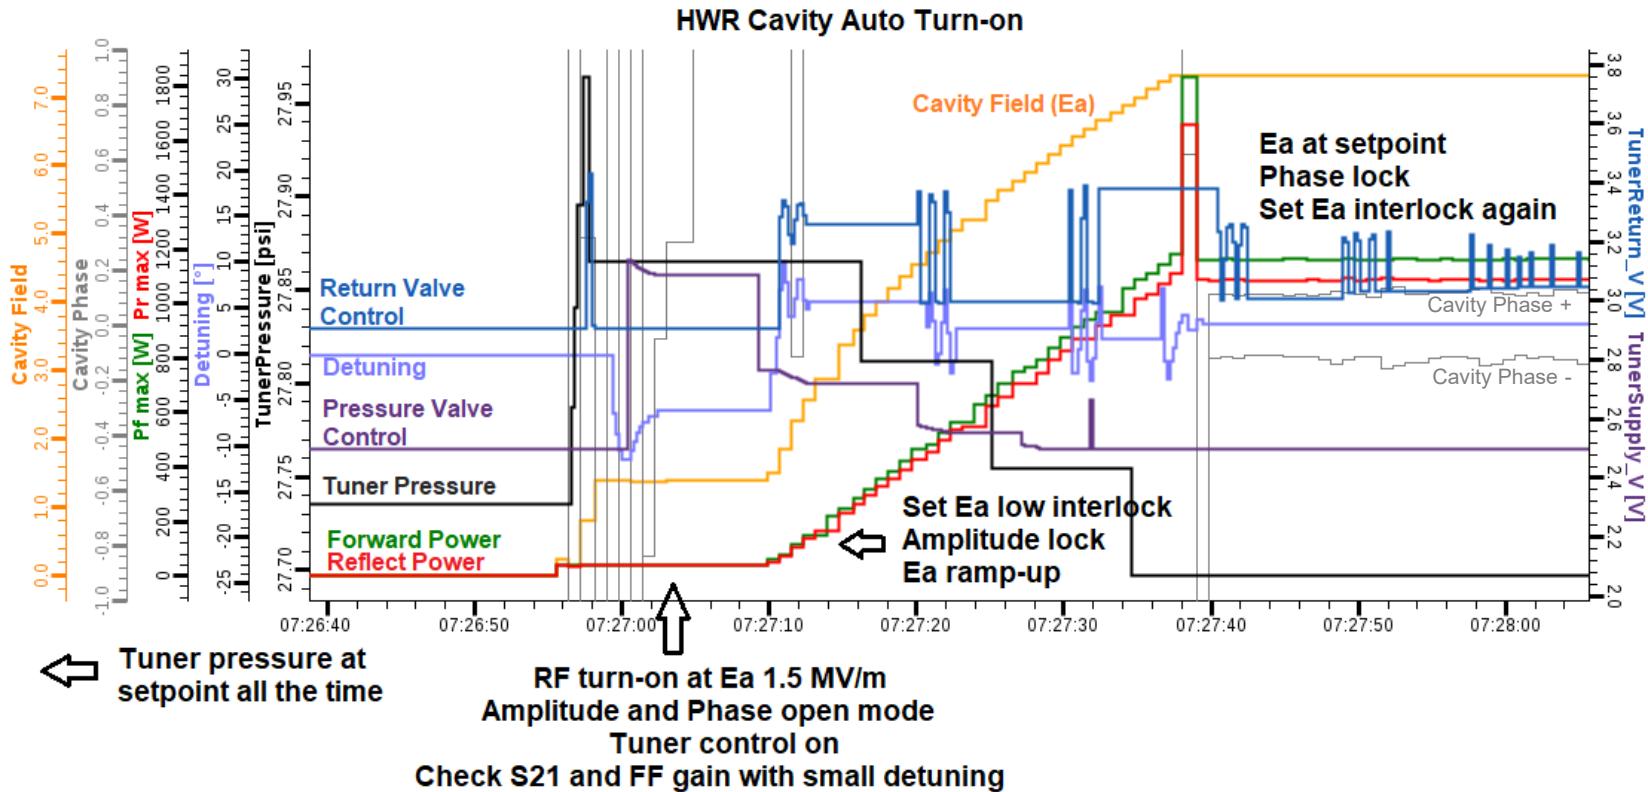

S. Kim, NAPAC'22

- Low MP jump through method confirmed in commissioning
 - Manual procedure requires multi-setting changes on neighboring FE cavities
- Implemented auto-run for high FE cavity field reducing then recovery
 - Fast recover cavity from trip by ~ 2 minutes
 - Reduce the required training level for operators

HWR Auto Turn-on

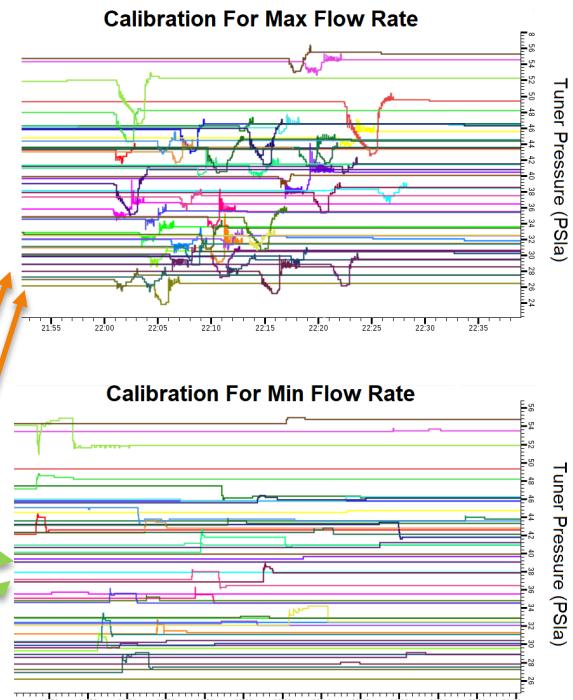

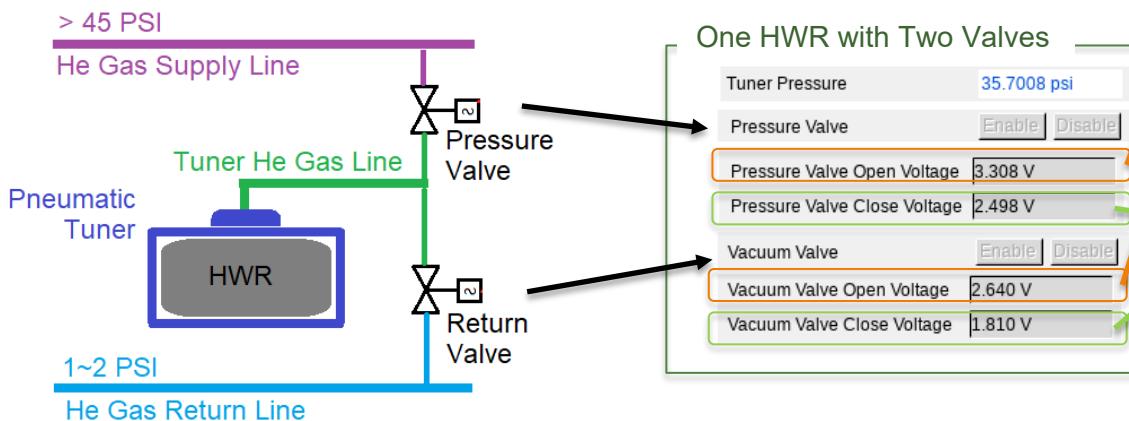

- Tuner valves control the tuner pressure at set-point before RF on
- Open loop mode for initial start then tuner run cavity to the center to do S21 check, FF gain adjust, amplitude lock and ramp-up

HWR Automation Improvement

Pneumatic Tuner Valve Calibration

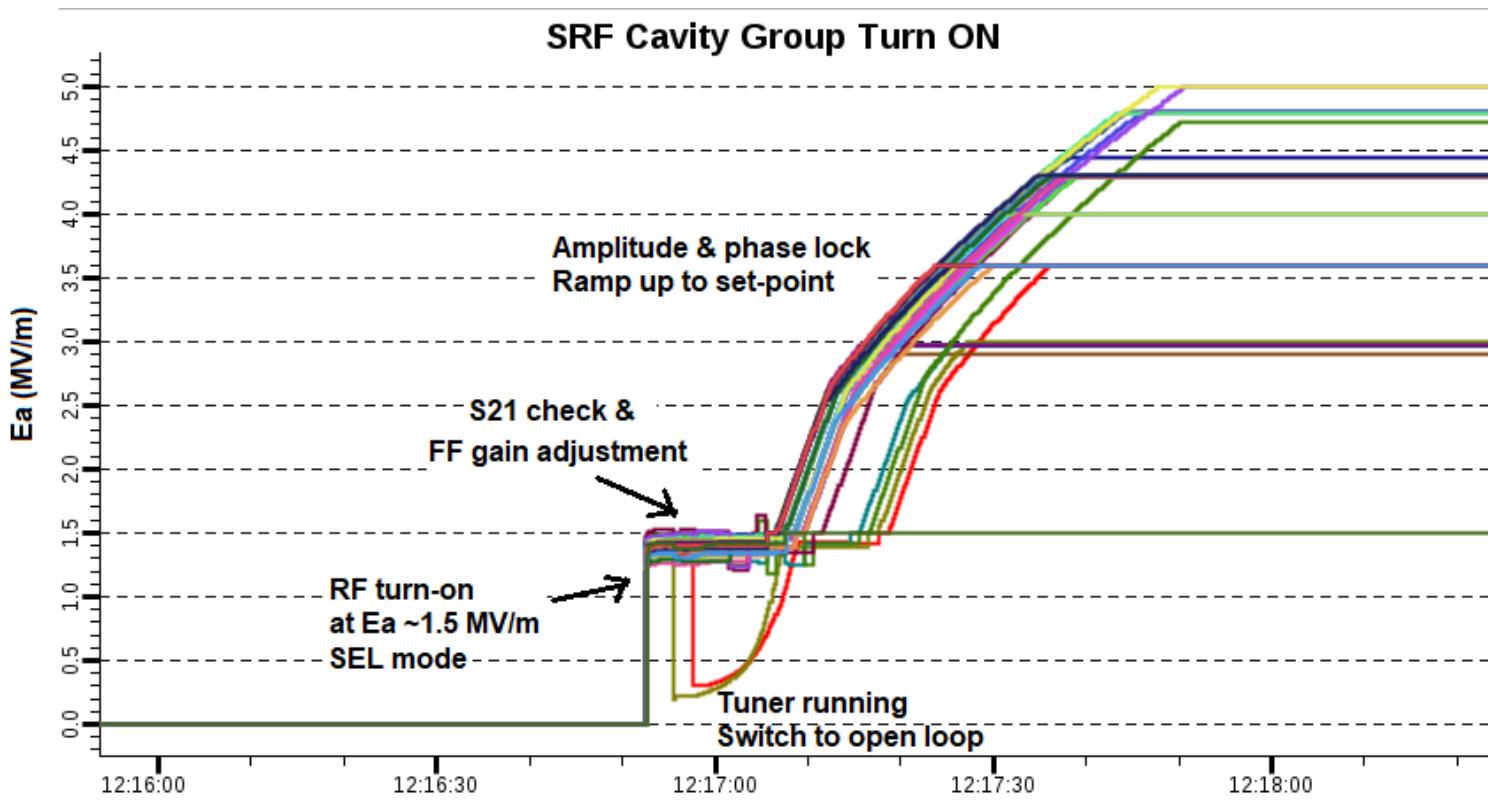

- Necessity of pneumatic tuner valve automatic calibration
 - Critical to HWR cavity automatic turn-on and tuner performance
 - Manual calibration by expert takes 3 min per valve, 440 valves must be calibrated to run the 220 HWRs
- Automation significantly reduces the time cost
 - Calibrate valves in parallel
 - Manual calibration of 440 valves takes **3 person-days** of SRF expert effort; reduced to **2 hours** of machine effort

Calibration for all valves:
1 hour for 'Open Voltage', 1 hour for 'Close Voltage'

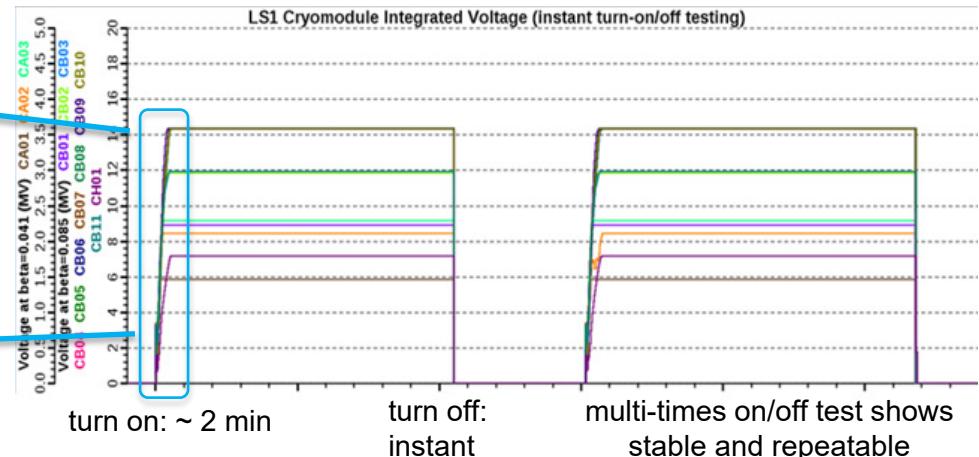

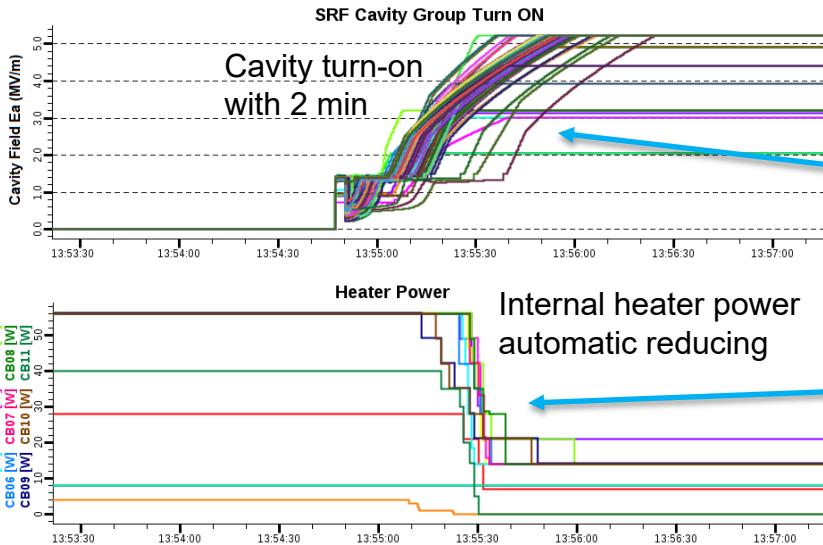

SRF Cavity Group Auto Turn-on

- SRF cavities be turned on by three group (LS1, LS2 & LS3)
 - Cavities in each group is able to be turned on within ~2 minutes

Cavity Dynamic Heat Load Auto Compensation

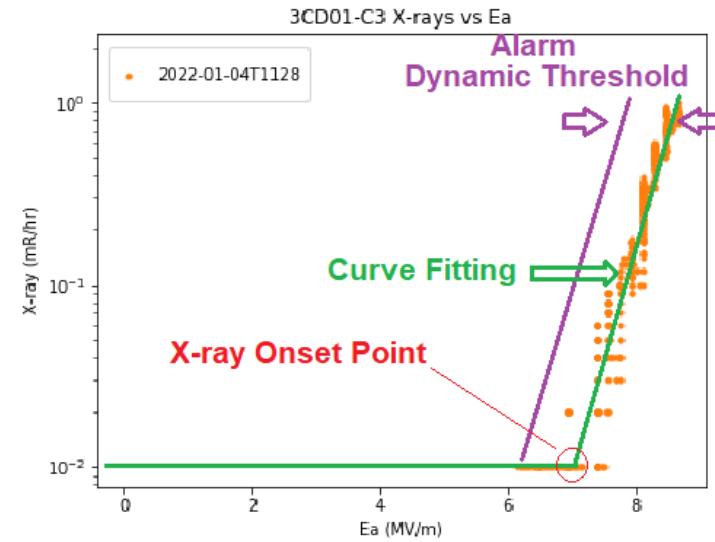

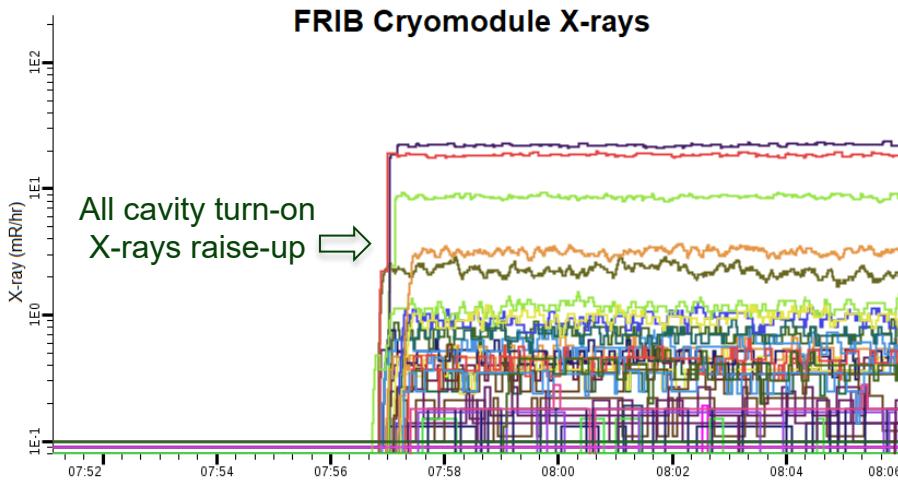

- Cavity fast turn-on/off with cavity auto-start and heater power auto compensation
 - Heater power configuration determined by AP, SRF and Cryo. and tested in commissioning
 - Available for FSEE (FRIB Single Event Effects) quick tunnel access (access tunnel four or five times a day)
 - » All 104 QWRs can be turned on in **2 minutes** and turned off in **2 seconds**

Improved from the previous ~1 hour turn-on

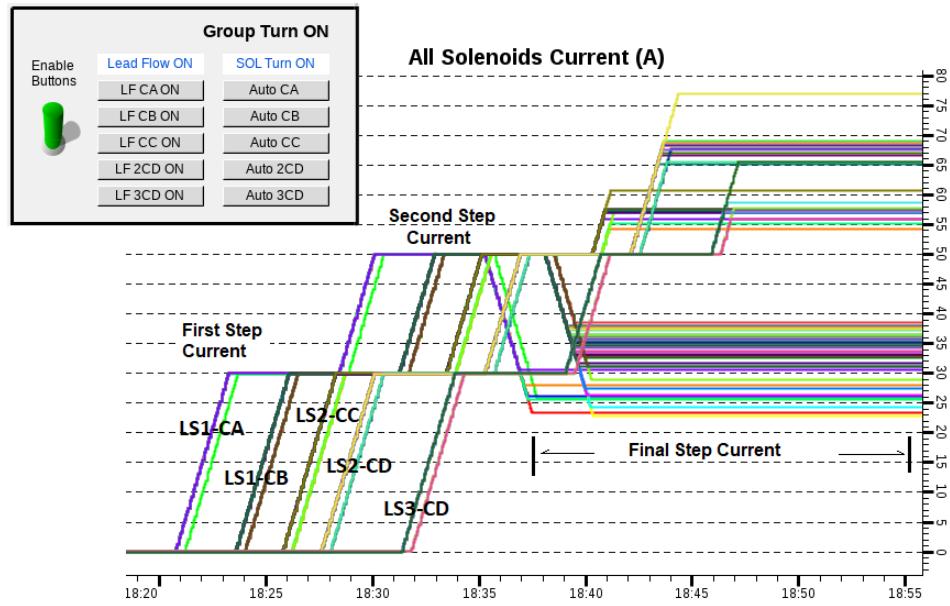

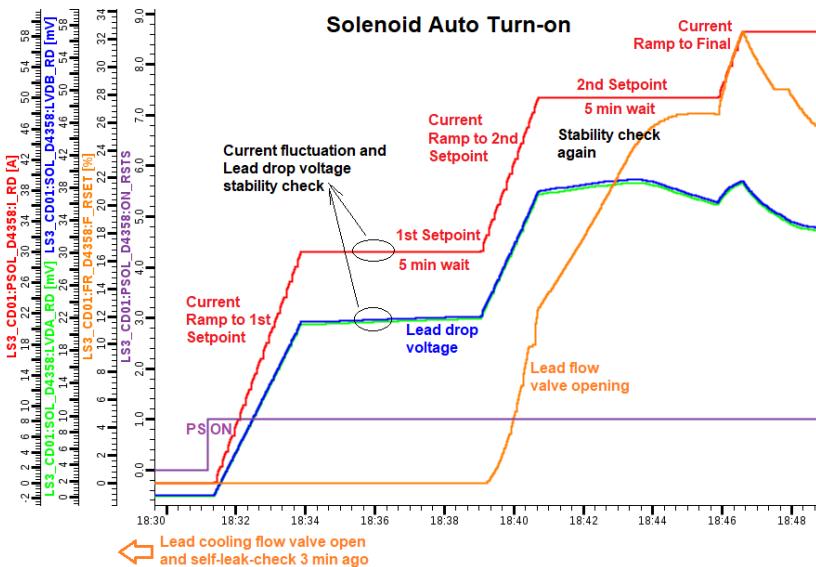

FE X-rays On-line Monitor/Alarm

- X-ray sensors installed on all 46 cryomodules
 - 2 sensors for each cryomodule (upstream & downstream) to track FE cavity performance
 - Monitor X-ray jump event and send out alarm
 - Fixed threshold for current alarm setting
 - Dynamic threshold settings for future
 - » Curve fitting based on FE cavity X-ray vs field scan data
 - » New alarms will match with different cavity at different fields

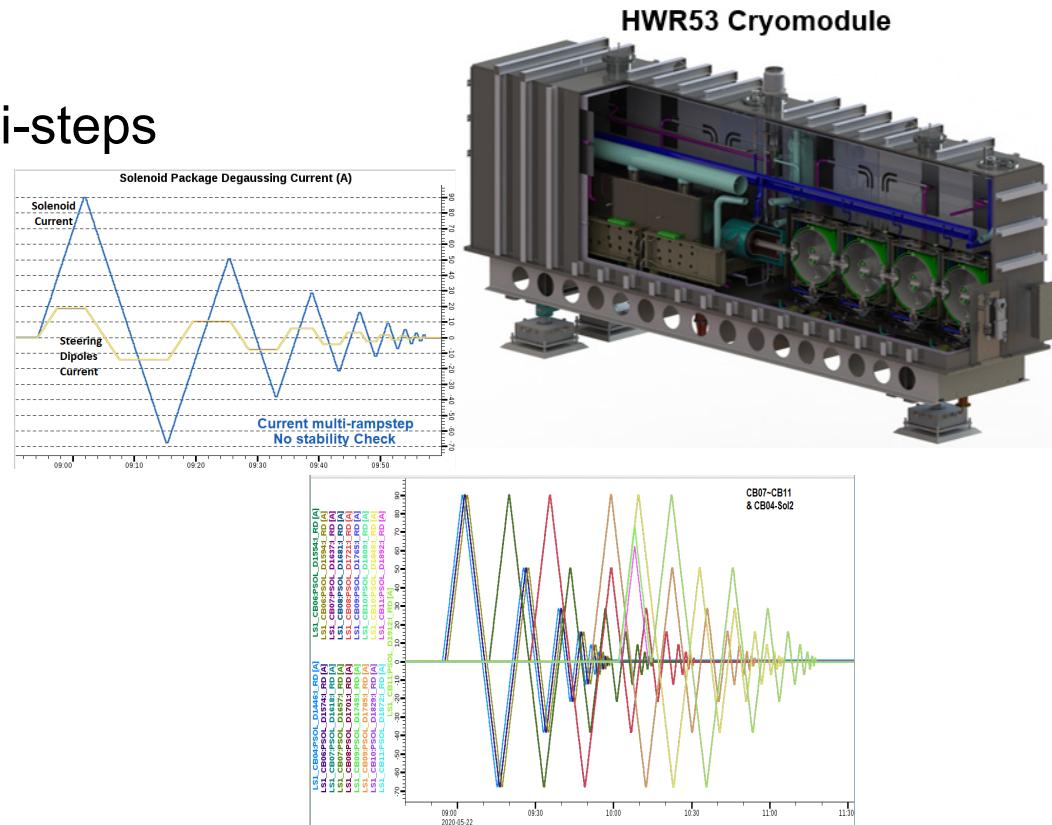

Solenoid Auto Turn-on

- Single solenoid auto start
 - Three steps current ramp-up with stability check for turn on procedure
- Five group turn-on implemented for 69 solenoid packages
 - All solenoid packages done with ramp-up and stability check within 30 minutes before the beam operation.

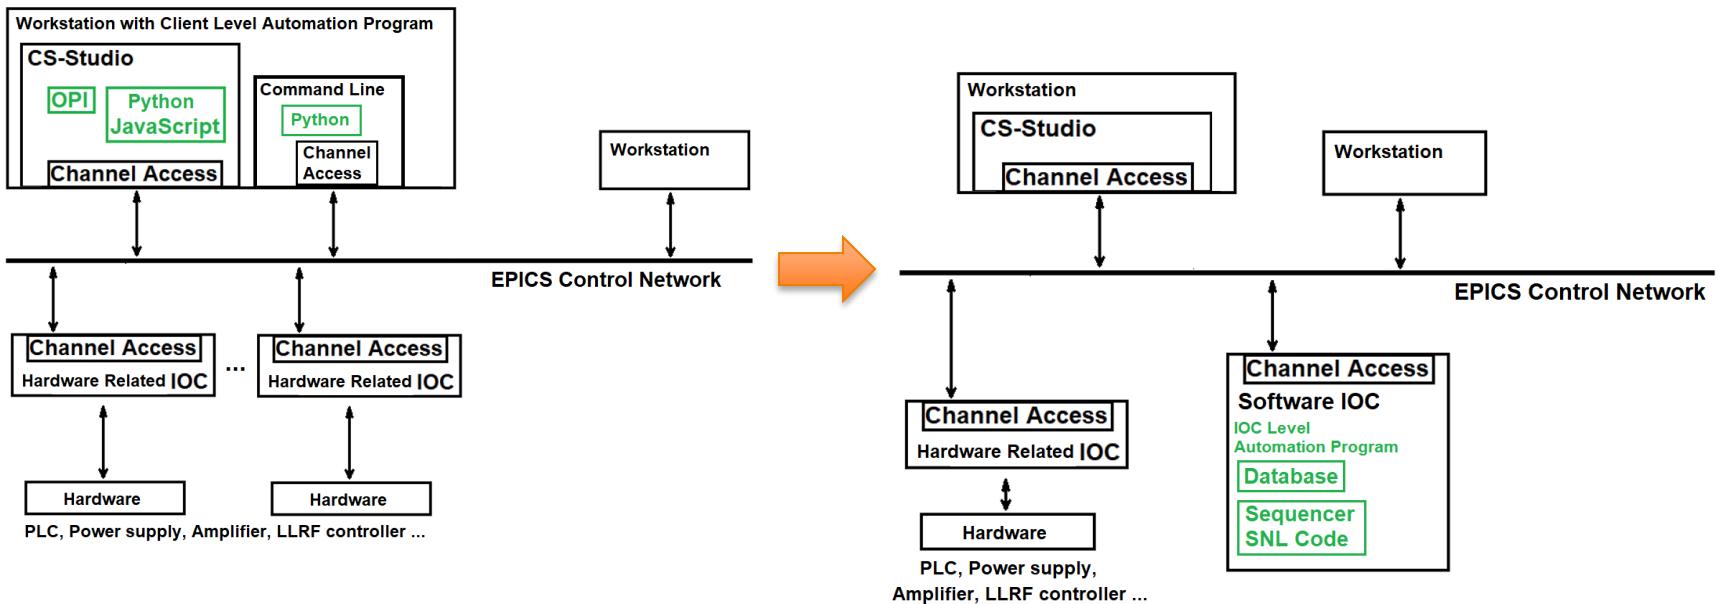

Solenoid Auto Degaussing

- Routine operation: degauss the solenoid prior to warm-up
 - Warm-up without degaussing observed 60% increase of the dynamic load.
 - Will establish an operation plan concerning about the unscheduled warm-up
- Fast run degaussing
 - One button automatic run multi-steps ramp on multi-solenoids

Automation Tools Implementation

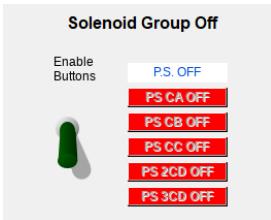

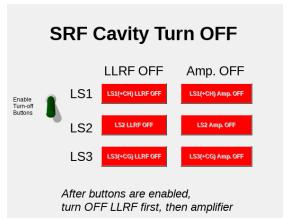

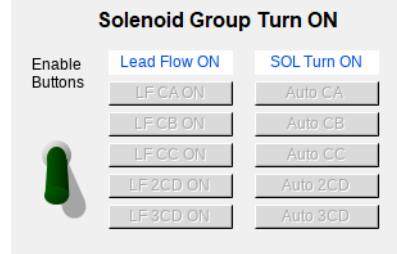

- Initial version “Client Level” scripts developed at the beginning
 - Easy to apply new changes (feedback from commissioning results)
- Final version automation programs are all transferred to “EPICS IOC Level”
 - More stable and reliable than client level machine
 - Access security control set limited permission for experts and operators

User Interface (UI) For Automation Tools

▪ Transition smoothly to operations

- For operators: very simple UI, using friendly, minimized training effort
- For experts: all details contained, available for single/multi/group device operation, easy for troubleshooting

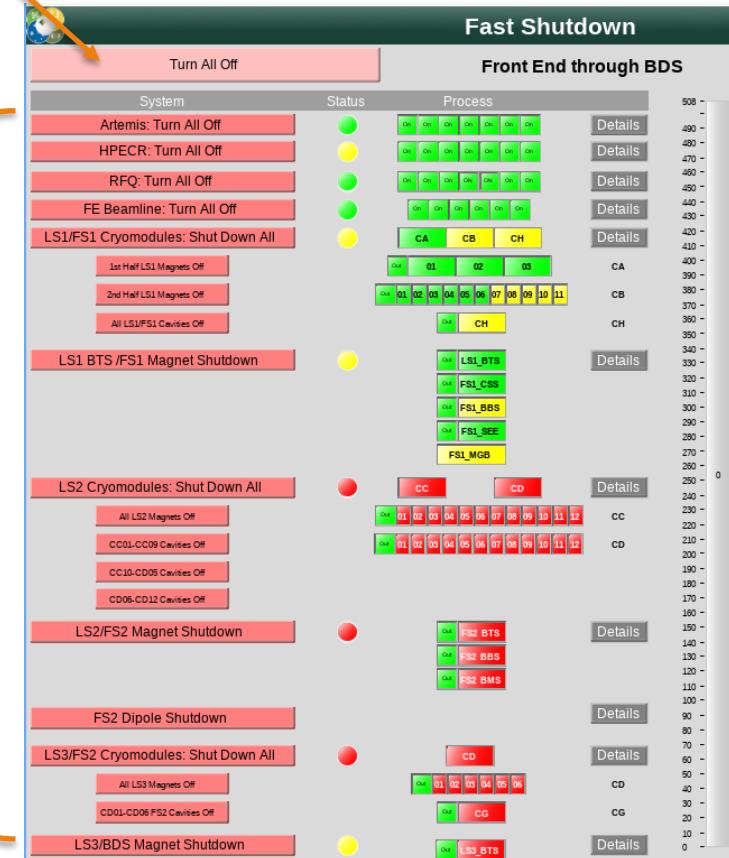

UI pages for operators

Emergency Shut-down

One button
shut-down
all devices

- Protect machine when emergency event happen

- Top level one button shut-down everything
- SRF cavity and SC solenoid shut-down linked to top one button
 - » SRF cavity: turn off LLRF drive first, then amplifier
 - » SC solenoid: ramp down coil current to zero, waiting 10 s, turn off power supply, close lead cooling flow valve
- All devices shut down through one click on Feb 13, 2023 MSU campus mass shooting

Summary

- Automation is essential for large scale superconducting devices operation. Automatic turn-on/off tools for FRIB SRF cavities and SC solenoid packages are implemented.
 - SRF cavity auto turn-on
 - » Internal heater power auto compensation
 - » Cavity field reduce and recover
 - » Pneumatic tuner auto calibration
 - Solenoid package auto turn-on, auto degaussing
 - Group fast turn-on 324 SRF cavities and 69 Solenoid packages (include solenoid degaussing execution)
 - Emergency one button fast shut-down
- Future automation tools will focus on machine high availability and reliability operation goal

Thanks for your attention!
